News

- Deliverable dates now on Web page
- Three iterations with use cases, prototypes
- First deliverables due in three weeks
- Discussion board now available
When an application has been designed to market or sell products or ideas, aesthetics may have as much to do with success as technical design.

What is good design?

Don't go to the right?

What do these symbols mean?

Real example from a (expensive) car (as in the picture, no idea which model)—the icons on the buttons placed on the car’s dashboard are unclear. I have highlighted the vague ones in red.
How much is the gas?

Examples of "cool" interfaces.

Some non-apple "cool" interfaces.
**Interface**

**definition**

interface
n. Computer Science

- The point of interaction or communication between a computer and any other entity, such as a printer or human operator.
- The layout of an application's graphic or textual controls in conjunction with the way the application responds to user activity: an interface whose icons were hard to remember.

---

**What is Design?**

- Design is not just what it looks like and feels like.
- Design is how it works.
What is Design?

Super cool chopstick - the front end doesn't touch the table.

It is easy to overdo design and make the product utterly useless.

User is centric to design. Every decision should be made keeping the user in mind.
User-Centric Design

- Cost saving!
- Competitive market - user expectations.
- Political demands
- Is Help always helpful?

Human Capabilities

- Memory
- Attention
- Visual Perception
- Learning
- Color
- Language + Communication
- Ergonomics

Memory

- Associations are built by repetition.
- Scaffold model (more likely to remember items that have many associations).
- Recognition is easier than recall.
- Working memory has small capacity.
- Long-term memory has large capacity.
Attention

- Attention is a resource – gets divided amongst tasks.
- Automatic well-learnt processes not need much attention.
- Important to get (for you as a designer).

Visual Perception

- We excel at pattern recognition.
- We automatically try to organize visual displays and look for cues.
- Motion, grouping, contrast, color can make different parts of a display more or less salient.

Learning

- Learning is improved by organization.
- Consistency and mnemonics improve learning.
- Targeted feedback facilitates learning.
- Learning occurs across people and organizations.
Learning

- Incrementally presented information accelerates learning.
- Some users like to explore systems to learn; others will not.
- Workers focus on accomplishing tasks, not learning software.

Color

- Red-green color blindness (protanopia & deuteranopia)
  - 8% of males
  - 0.4% of females
- Blue-yellow color blindness (tritanopia)
  - Far more rare
- Guideline: don’t depend solely on color distinctions
  - use redundant signals: brightness, location, shape

Protanopia = absence of red receptors
Deuteranopia = absence of green receptors
Tritanopia = absence of blue receptors

Traffic lights are readable even for color-blind people (due to location of lights). Also notice the blueish tint in the “green” light.
Example of an Ishihara color test plate. [Note 1] The numeral “74” should be clearly visible to viewers with normal color vision. Viewers with dichromacy or anomalous trichromacy may read it as “21”, and viewers with achromatopsia may not see numbers. [Wikipedia]

Here's another one. Readers with normal vision are not supposed to clearly see a number here.

Language + Communication

syntax, semantics, pragmatics; conversational interaction, specialized languages
Ergonomics

arrangement of displays and controls; cognitive and sensory limits; effects of display technology; fatigue and health; furniture and lighting; design for stressful and hazardous environments; design for the disabled...

Where does user-centered design fit into the development process?

Traditional Waterfall Model
Traditional Waterfall Model

Waterfall Model Poor for UI Design

- UI design is risky.  
  - So we are likely to get it wrong.
- Users are not involved in validation until acceptance testing.  
  - So we won’t find out until the end.
- UI flaws often cause changes in requirements and design.  
  - So we have to throw away carefully written and tested code.

Iterative Design

Iterative design is the current best-practice process for developing user interfaces. It’s a specialization of the spiral model described by Boehm for general software engineering.
Why NOT Iterative Design?

- Every iteration corresponds to a release
  - Evaluation (complaints) feeds back into next version’s design
- Using your paying customers to evaluate your usability
  - They won’t like it
  - They won’t buy version 2

Spiral Model

Each iteration has a cost or fidelity or accuracy

Spiral Model Iterations

- Early iterations use cheap prototypes (paper prototyping).
- Later iterations have richer implementations.
- More iterations generally means better UI.
- Only mature iterations are seen by the world.
Paper Prototyping

Credits: Nielsen Norman Group
Wireframing

One may also compose parts of these on a computer, of course (at various levels of detail, up to a full-fledged mockup)

Benefits

• Fast way to mock up an interface - no coding required.
• Finds a variety of problems with the interface.
• Allows an interface to be refined based on user feedback before implementation begins.
• A multidisciplinary team can participate.
• Encourages creativity from the product team and users alike.

Disadvantage

• Doesn’t produce any code.
• Does not find all classes of problems with an interface.
• Can affect the way users interact with the interface.
• Users might think it is unprofessional.
• Has stronger benefits in some situations than in others.

For 2nd pt., imagine you need to test how to draw a curved line on Adobe Photoshop or how to operate an ego shooter. Paper prototyping is not the best way!
UI Analysis & Design

- Iterative Design using a Spiral Model.
- Early focus on users and tasks.
  - User analysis: who the users are.
  - Task analysis: what they need to do?
  - Involve users as evaluators, consultants and sometimes designers.
- Constant Evaluation

Know Your User

- Novice
- Knowledgeable, intermittent user
- Knowledgeable, frequent user
- Age, gender, ethnicity
- Physical abilities
- Domain experience
- Application experience
- Work environment
- Communication patterns

Know Your User

- Techniques
  - Questionnaires
  - Interviews
  - Observations
- Obstacles
  - Artificial barriers between developers and users.
  - Some users are expensive to talk to.
User Design Principles

Usability Principles

Nielsen’s 10 Principles
Of UI Design

Nielsen’s Principles

1. Match the real world
2. Consistency and Standards
3. Help and Documentation
4. User Control and Freedom
5. Visibility of System Status
6. Flexibility and Efficiency
7. Error Prevention
8. Recognition, not Recall
9. Error Reporting, Diagnosis, Recovery
10. Aesthetic and Minimalist Design
Match the Real World

• Examples
  • Desktop
  • Trashcan
• Dangers of metaphors
  • Often hard for designers to find
  • Deceptive
  • Constraining
  • Breaking the metaphor
• Use of a metaphor doesn’t excuse other bad design decisions

Direct Manipulation

• User interacts with visual representation of data objects
  • Continuous visual representation
  • Physical actions or labeled button presses
  • Rapid, incremental, reversible, immediately visible effects
• Examples
  • Files and folders on a desktop
  • Scrollbar
  • Dragging to resize a rectangle
  • Selecting text
• Visual representation and physical interaction are important
Affordances
of direct manipulation

- Perceived and actual properties of a thing that determine how the thing could be used
  - Chair is for sitting
  - Knob is for turning
  - Button is for pushing
  - ListBox is for selection
  - Scrollbar is for continuous scrolling or panning
- Perceived vs. actual

Natural Mapping

- Physical arrangement of controls should match arrangement of function
- Best mapping is direct, but natural mappings don’t have to be direct
  - Light switches
  - Stove burners
  - Turn signals
  - Audio mixer

Feedback / Responsiveness

- Actions should have immediate, visible effects
  - Push buttons
  - Scrollbars
  - Drag & drop
- Kinds of feedback
  - Visual
  - Audio
  - Haptic (conveyed by sense of touch)
Consistency and Standards

Guidelines for Mac, Windows, Gnome, KDE, Android, iOS...

UI and writing!

Help and Documentation

Help should be (a) searchable, (b) context-sensitive, (c) task sensitive, (d) concrete, (e) short, (f) not needed

User Control and Freedom

Provide Undo
Long operations should be allowed to be paused/suspended
all dialogs should have a cancel button
**Visibility of System Status**

- Use highlights to show selected objects
- Use status bar to show progress

**Flexibility and Efficiency**

- Recently-used history is one very useful kind of shortcut, like this recently-used files menu

**Error Prevention**

- Murphy’s Law - “if something can go wrong, it will”
- One way to prevent errors is to allow users to select rather than type.
- Misspellings then become impossible.
Recognition, not Recall

- use menus, not command languages
- use combo boxes, not textboxes
- use generic commands
- all needed information must be visible

Error Reporting, Diagnosis, Recovery

A good error message should (1) be precise; (2) speak the user’s language, avoiding technical terms and details unless explicitly requested; (3) give constructive help; and (4) be polite

Aesthetic and Minimalist Design
If you look at a recent Microsoft package, they have learned (copied) a lot.

User Interface Testing

- How do you know you did everything well?
- Only way: Have real users test it!
Email "A Tale of Two Cities"

This task was performed using Suse 9.3 in a Portable Lab on the GNOME desktop. The test was administered in English. The following is a description of the task:

Your friend Arthur loves "A Tale of Two Cities". Please email the electronic book to him. His email address is arthur@ximian.com.

Issues Encountered

- Mail Client is referred to as “Evolution” (not “Mail” or similar)
- “Send/Receive” Button does not compose mail (but syncs with server)
- Attachment list hidden by default
- 20% of users failed to send mail
- Average successful time was 4:23 minutes

Typically, when project managers observe their design undergoing a usability test, their initial reaction is:

*Where did you find such stupid users?*

---

The following heatmap from one of our eyetracking studies shows how users looked at this homepage. Their task was to find the current population of the United States.

---

This and the following are poor examples of GUI design. In this slide, there is basically so many options, full of text, non-descriptive icons.
Tabs

Too many tabs???

Rewind

This seems to be a print dialog. Only the designers know what does the "rewind" button mean.

Help

MS super letter writing assistant!

In Microsoft Assistant Killed in Denver, it was reported that Microsoft program managers demonstrated a technique to kill the assistant to a crowd attending a development conference.
On MS-word, there are so many possible effects on the same text. Note that options such as Strikethrough and Doublestrikethrough can be opted together for the same text. Similarly subscript and supersubscript.

Puzzle

"503 polite people say hello first"
The poor secretary, confronted with this message, simply typed "mismatch" – without success :-(

The button to control the audio is under “Beamer” (Projector) on the right, but not under “Audio”.

Summary
