[How to buy bitcoins?](#)

[Contact Us](#)

## What Happened to My Computer?

Your important files are encrypted.

Many of your documents, photos, videos, databases and other files are no longer accessible because they have been encrypted. Maybe you are busy looking for a way to recover your files, but do not waste your time. Nobody can recover your files without our decryption service.

## Can I Recover My Files?

Sure. We guarantee that you can recover all your files safely and easily. But you have not so enough time.

You can decrypt some of your files for free. Try now by clicking <Decrypt>.

But if you want to decrypt all your files, you need to pay.

You only have 3 days to submit the payment. After that the price will be doubled.

Also, if you don't pay in 7 days, you won't be able to recover your files forever.

We will have free events for users who are so poor that they couldn't pay in 6 months.

## How Do I Pay?

Payment is accepted in Bitcoin only. For more information, click <About bitcoin>.

Please check the current price of Bitcoin and buy some bitcoins. For more information, click <How to buy bitcoins>.

And send the correct amount to the address specified in this window.

After your payment, click <Check Payment>. Best time to check: 9:00am - 11:00am

CMT from Monday to Friday

**Send \$300 worth of bitcoin to this address:**

# The Internet of ransomware things...

# Highjacking a Car

# Highjacking a Car

- All car components are connected via a bus system (CAN bus)
- Includes engine control, power steering, controls, entertainment system
- Hardware controls tight *access rules* – e.g. entertainment system can only read, not write

# Highjacking a Car

1. Connect to *entertainment system* via *public WiFi access*
2. *Exploit vulnerability* to get control over system
3. *Flash* chip that controls CAN bus access to get full writing capabilities
4. Voilá! Full control over car.

# A Simple Vulnerability

```
while ((cc = getch()) != c)
{
    name[j++] = cc;
    ...
}
```

- No checking for length of buffer `name`
- Can overwrite stack with *code* and new *return address* that jumps into code

# Security by Proof

Systems that are *provably secure* ensure that

- specific attacks are *impossible*  
e.g. no buffer overflows, or no SQL injection
- they will always *behave as designed*  
e.g. will always produce a correct result

Requires (expensive) mathematical proof

# Security by Testing

Systems that are thoroughly *tested* ensure

- *Low probability* of attack success because several attacks already have been tested
- *High complexity* of remaining attacks because simple attacks already have been tested
- Cost-efficient if highly *automated*

## **Summary**

Operating system facilities, such as the kernel and utility programs, are typically assumed to be reliable. In our recent experiments, we have been able to crash 25-33% of the utility programs on any version of UNIX that was tested. This report describes these tests and an analysis of the program bugs that caused the crashes.

# Fuzzing UNIX utilities

- Use fuzzed output as a prolog program:  
`$ python fuzzer.py | prolog`
- Use fuzzed output as an input to grep:  
`$ python fuzzer.py | grep x`
- Use fuzzed output as a TeX document:  
`$ python fuzzer.py | tex`

*Demo*

# fuzzer.py

```
import random

def fuzzer():
    # Strings up to 1024 characters long
    string_length = int(random.random() * 1024)

    # Fill it with ASCII 32..128 characters
    out = ""
    for i in range(0, string_length):
        out += chr(int(random.random() * 96 + 32))
    return out

if __name__ == "__main__":
    print fuzzer()
```

# Reasons for Crashes

- Pointers and arrays
- Not checking return codes
- And more...

# Pointers and Arrays

```
while ((cc = getch()) != c)
{
    string[j++] = cc;
    ...
}
```

```
char rdc()
{
    char lastc;

    do {
        lastc = getchar();
    } while (lastc != ' ' ||
            lastc != '\t');

    return (lastc);
}
```

# Not checking Return Codes

# And more...

- Send "!o%8888888888f" as command to the csh command-line shell
- Invoke this with string =  
"%8888888888f":

```
char *string = ...  
printf(string);
```

# Safe Coding

- Check all array references for valid bounds
- Apply bounds on all inputs
- Check all system call return values
- Never trust third-party inputs

...all of which is supported by modern languages

...but there are newbie programmers born every minute

# Grammar Inference in Python

- We can track *variables + values* in Python
- We cannot track their dynamic taints
- But we can identify *substrings* of the input

# Grammar Inference in Python

- Start with grammar  $\$START \rightarrow input$
- For each  $(var, value)$  we find during execution, where  $value$  is a substring of  $input$ :
  1. In the grammar, replace all occurrences of  $value$  by  $\$VAR$
  2. Add a new rule  $\$VAR \rightarrow value$

*Demo*

# Tracking

*# We store individual variable/value pairs here*

```
global the_values  
the_values = {}
```

*# The current input string*

```
global the_input  
the_input = None
```

*# We record all string variables and values occurring during execution*

```
def traceit(frame, event, arg):  
    global the_values  
    variables = frame.f_locals.keys()
```

```
    for var in variables:  
        value = frame.f_locals[var]
```

*# Save all non-trivial string values that also occur in the input*

```
    if type(value) == type('') and len(value) >= 2 and value in the_input:  
        the_values[var] = value
```

```
    return traceit
```

```
the_input = "..."  
sys.settrace(traceit)  
program_under_test(the_input)
```

# Grammar Expansions

```
# Obtain a grammar for a specific input
def get_grammar(input):
    # Here's our initial grammar
    grammar = {"$START": [input]}

    # We obtain a mapping of variables to values
    global the_input
    the_input = input

    global the_values
    the_values = {}

    sys.settrace(traceit)
    o = urlparse(the_input)
    sys.settrace(None)

    # Now for each (VAR, VALUE) found:
    # 1. We search for occurrences of VALUE in the grammar
    # 2. We replace them by $VAR
    # 3. We add a new rule $VAR -> VALUE to the grammar
    while True:
        new_rules = []
        for var in the_values.keys():
            value = the_values[var]
```

# Fuzzing File

The image is a screenshot of a web browser displaying the Wikipedia article titled "List of file formats". The browser's address bar shows the URL "en.wikipedia.org/wiki/List\_of\_file\_formats". The page features the standard Wikipedia layout, including a sidebar on the left with navigation links like "Main page", "Contents", and "Featured content". The main content area has a heading "List of file formats" and a sub-heading "From Wikipedia, the free encyclopedia". A notice in italics states: "This is a *dynamic list* and may never be able to satisfy particular standards for completeness. You can help by *expanding it with reliably sourced entries*." Below this, it says "See also: *List of filename extensions*". The main text explains that this is a list of file formats used by computers, organized by type, and notes that filename extensions are usually noted in parentheses if they differ from the format name or abbreviation. It mentions that many operating systems do not limit filenames to a single extension shorter than 4 characters, as was common with some operating systems that supported the FAT file system. Examples of operating systems that do not impose this limit include Unix-like systems, and Microsoft Windows NT, 95, 98, and Me, which do not have a three character limit on extensions for 32-bit or 64-bit applications on file systems other than pre-Windows 95/Windows NT 3.5 versions of the FAT file system. Some filenames are given extensions longer than three characters. It also notes that some file formats may be listed twice or more, with an example of the .b file. At the bottom, there is a "Contents" section with a "hide" link, listing sections like "1 Archive and compressed" and "2 Computer-aided Design".

## List of file formats

From Wikipedia, the free encyclopedia

*This is a **dynamic list** and may never be able to satisfy particular standards for completeness. You can help by **expanding it with reliably sourced entries**.*

*See also: **List of filename extensions***

This is a **list of file formats** used by **computers**, organized by type. **Filename extensions** are usually noted in parentheses if they differ from the **format** name or abbreviation. Many operating systems do not limit filenames to a single extension shorter than 4 characters, as was common with some operating systems that supported the **FAT** file system. Examples of operating systems that do not impose this limit include **Unix-like** systems. Also, **Microsoft Windows NT, 95, 98, and Me** do not have a three character limit on extensions for **32-bit** or **64-bit** applications on **file systems** other than pre-Windows 95/Windows NT 3.5 versions of the **FAT** file system. Some filenames are given extensions longer than three characters.

Some file formats may be listed twice or more. An example is the **.b** file.

```

java.net.URL.set(protocol, host, port, authority, userinfo, path, query, ref)
| http user:password@www.google.com:80/command foo=bar&lorem=ipsum fragment
param: protocol
| http
param: host www.google.com
param: port
| ..... 80 .....
param: authority
| ..... user:password@www.google.com:80 .....
param: userinfo
| ..... user:password .....
param: path
| ..... /command .....
param: query
| ..... foo=bar&lorem=ipsum .....
param: ref
| ..... fragment .....

```

```

URL ::= PROTOCOL '://' AUTHORITY PATH '?' QUERY '#' REF
AUTHORITY ::= USERINFO '@' HOST ':' PORT
PROTOCOL ::= 'http'
USERINFO ::= 'user:password'
HOST ::= 'www.google.com'
PORT ::= '80'
PATH ::= '/command'
QUERY ::= 'foo=bar&lorem=ipsum'
REF ::= 'fragment'

```

## Current Research

## Research Opportunities

- Dynamic taints from C and Java programs
- Active + sample-free learning of grammars
- Guiding fuzzing towards code coverage
- Integration with symbolic testing
- Build the *world's best fuzzing platform!*

- *What is the input language of a program?*
- How can I leverage input structure to
  - cover
  - understand
  - prevent
- inputs
- code
- behaviors
- Hundreds of open issues! **(and theses)**
