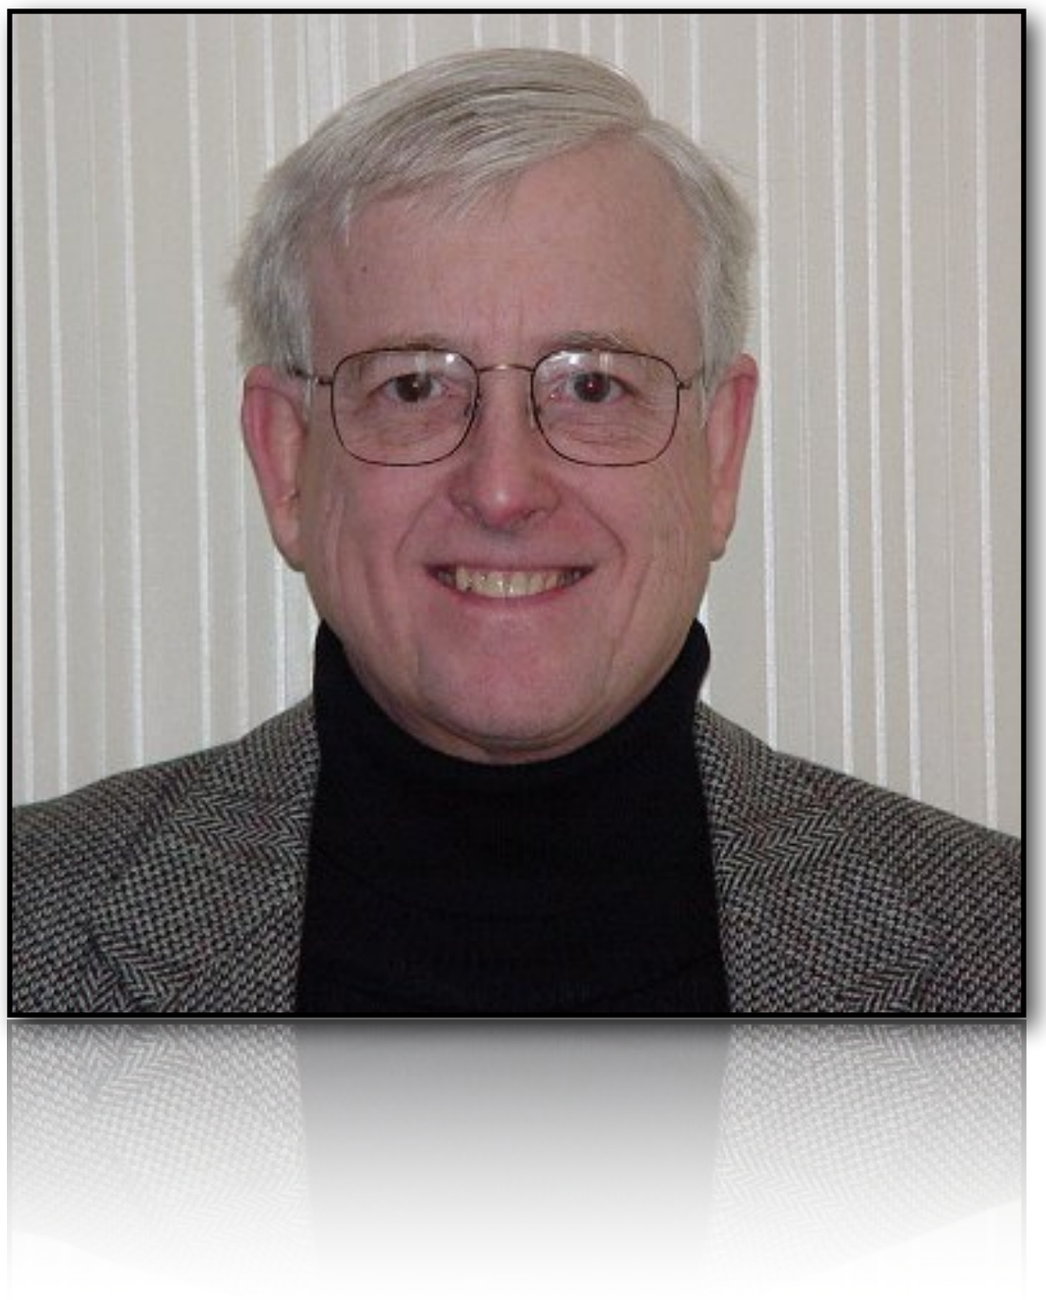
Software Project Management

Sudipta Chattopadhyay

Slides by: Sudipta Chattopadhyay, Rahul Premraj, Andreas Zeller

Software Project Management

Caper Jones



- Investigated 250 large projects.
- Unsuccessful projects showed weaknesses in:
  - Project Planning
  - Cost Estimation
  - Measurements
  - Milestone Tracking
  - Change Control
  - Quality Control

Software Project Management

Caper Jones

...the most interesting aspect of these six problem areas is that all are associated with project management rather than with technical personnel.

Laws of Project Management

- No major project is ever installed on time, within budget and with the same staff.

- Projects progress quickly until 90% complete; then they remain at 90% complete forever.

Laws of Project Management

- No system is ever completely debugged
  - More you debug, more bugs you introduce :-)

Four Ps of Project Management

People

Product

Process

Project

People

The most important ingredient that was successful on this project was having smart people... very little else matters in my opinion.

People

Communication & Coordination

Four Ps of Project Management

People

Product

Process

Project

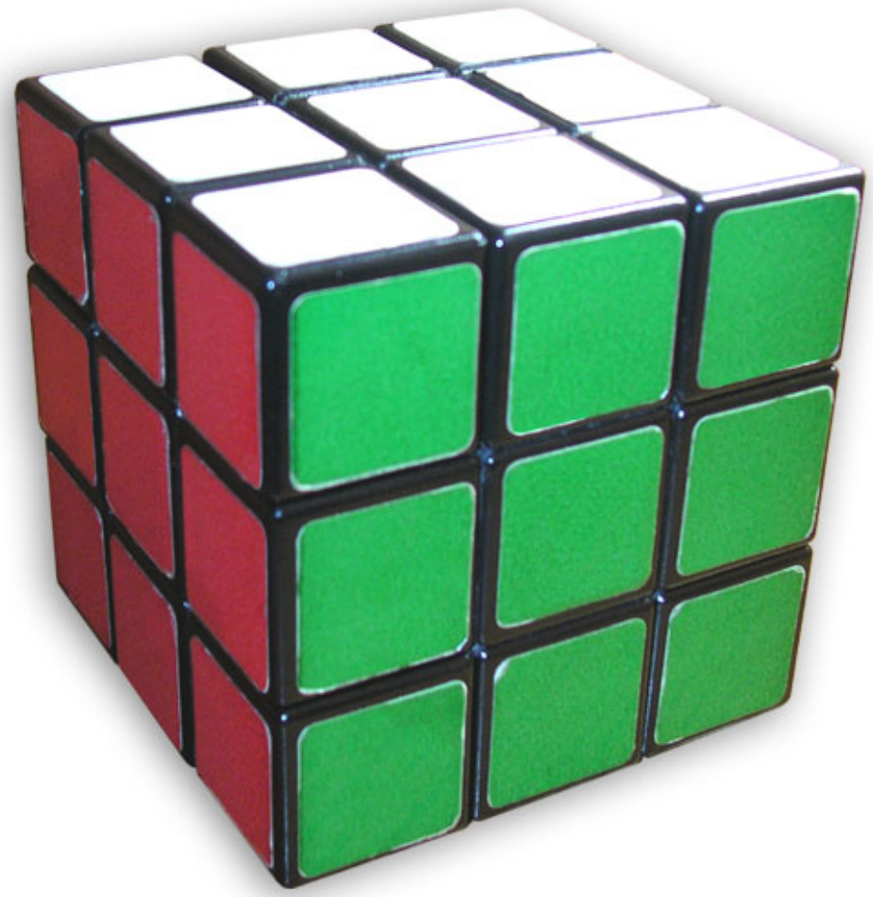
Product

Define the Scope of the Project

- Context: How does the software fit into a larger system, product, or business context, and what constraints are posed?
- Information objectives: What are the inputs and outputs of the system?
- Function and performance: What functions are to be performed to transform the inputs to outputs?

Product

Divide & Conquer



Four Ps of Project Management

People

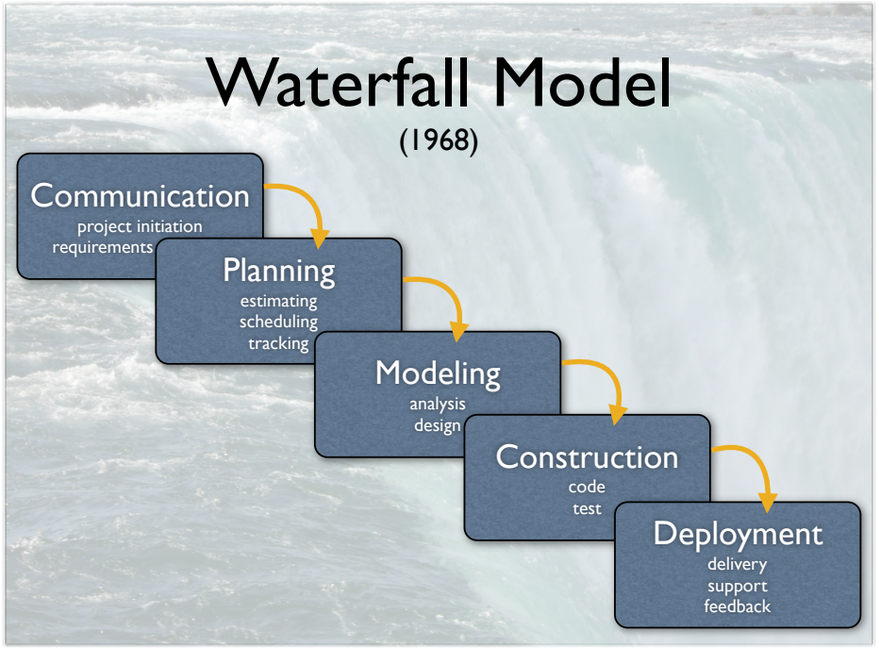
Product

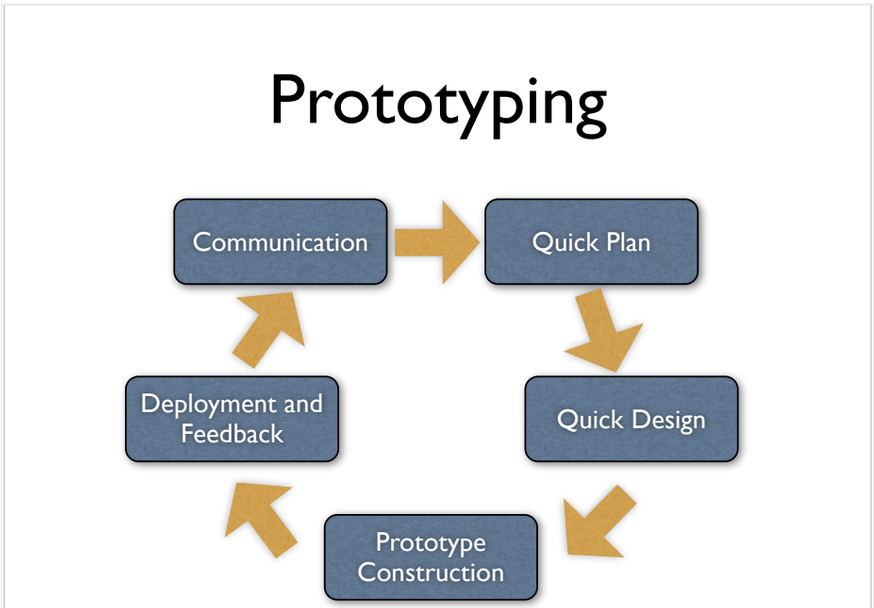
Process

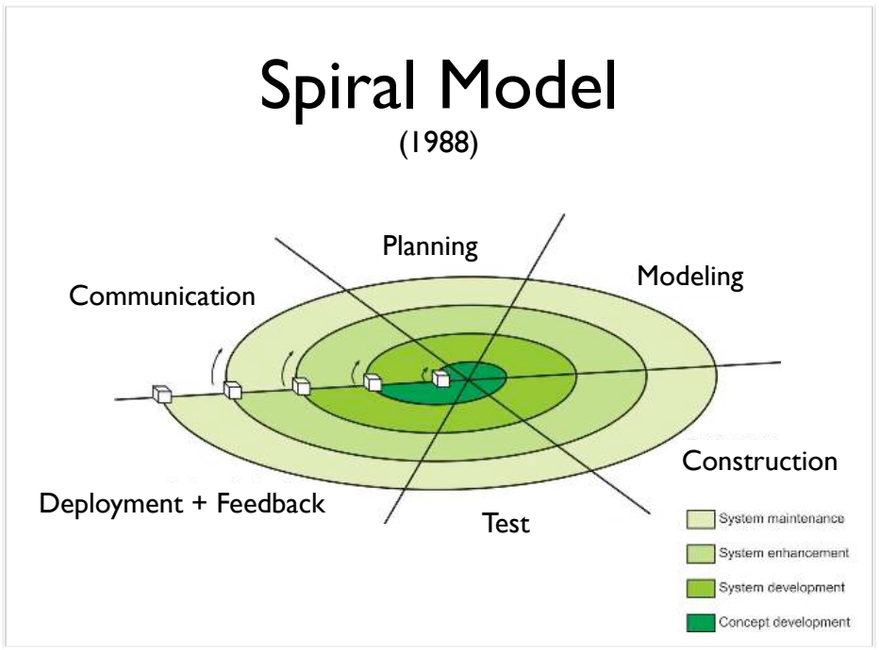
Project

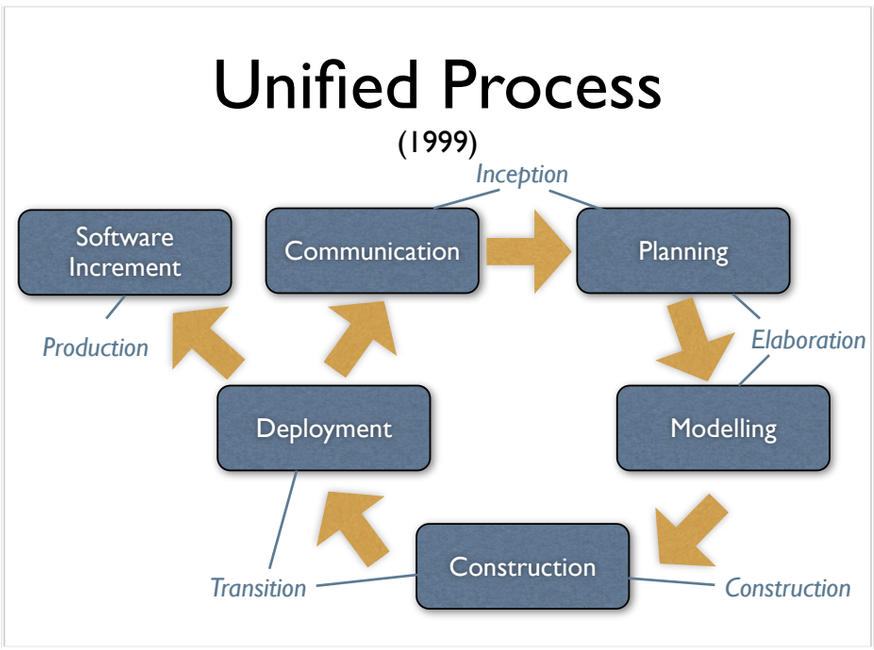
Process

Many processes to choose from!









Process

What to keep in mind while choosing the process?

- customers who requested the product and the end-users.
- the product's characteristics.
- the project environment in which the software is developed.

Four Ps of Project Management

People

Product

Process

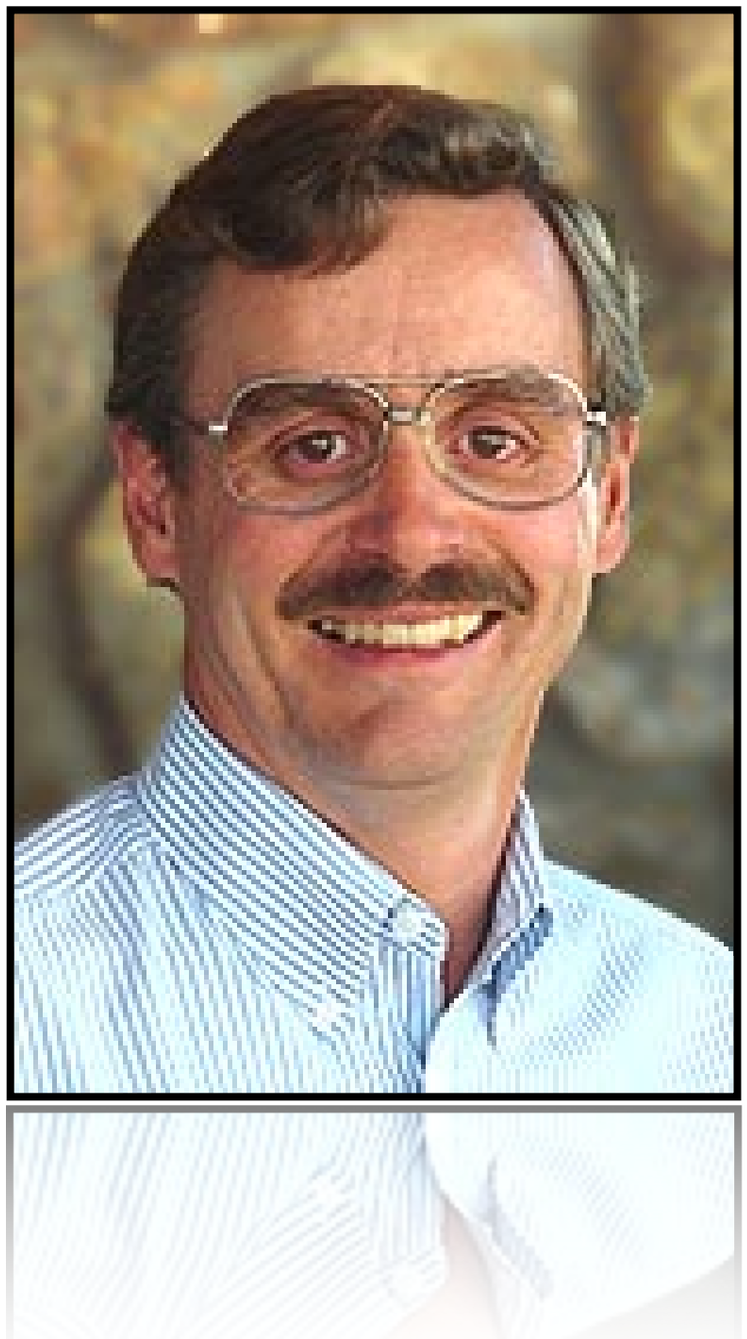
Project

Signs of Failure

- Development team doesn't understand customer's needs.
- Product scope is poorly defined
- Poorly managed changes.
- Chosen technology changes.
- Unrealistic deadlines.
- Inexperienced team.
- Poor management.

Project

Tom Cargill



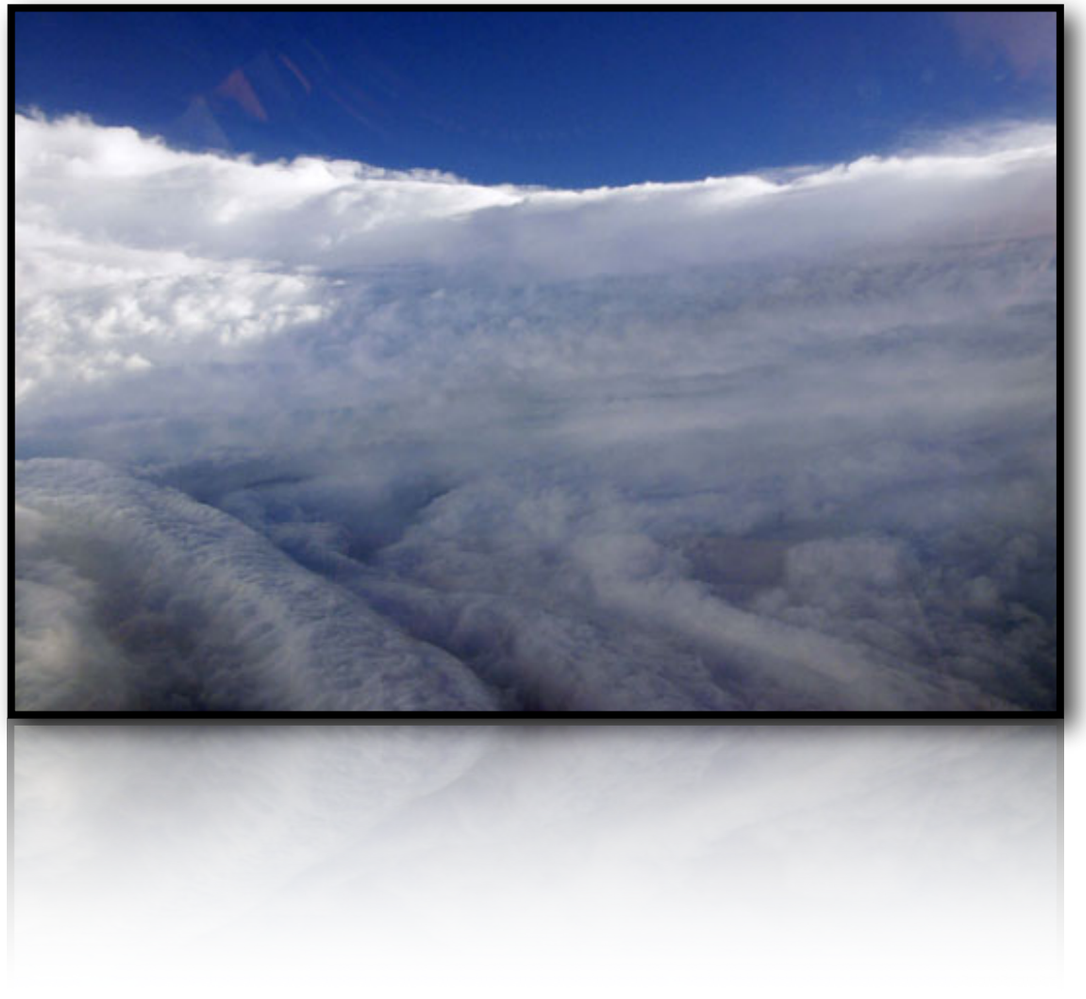
The first 90% of the code accounts for the first 90% of the development time.

The remaining 10% of the code accounts for the other 90% of the development time.

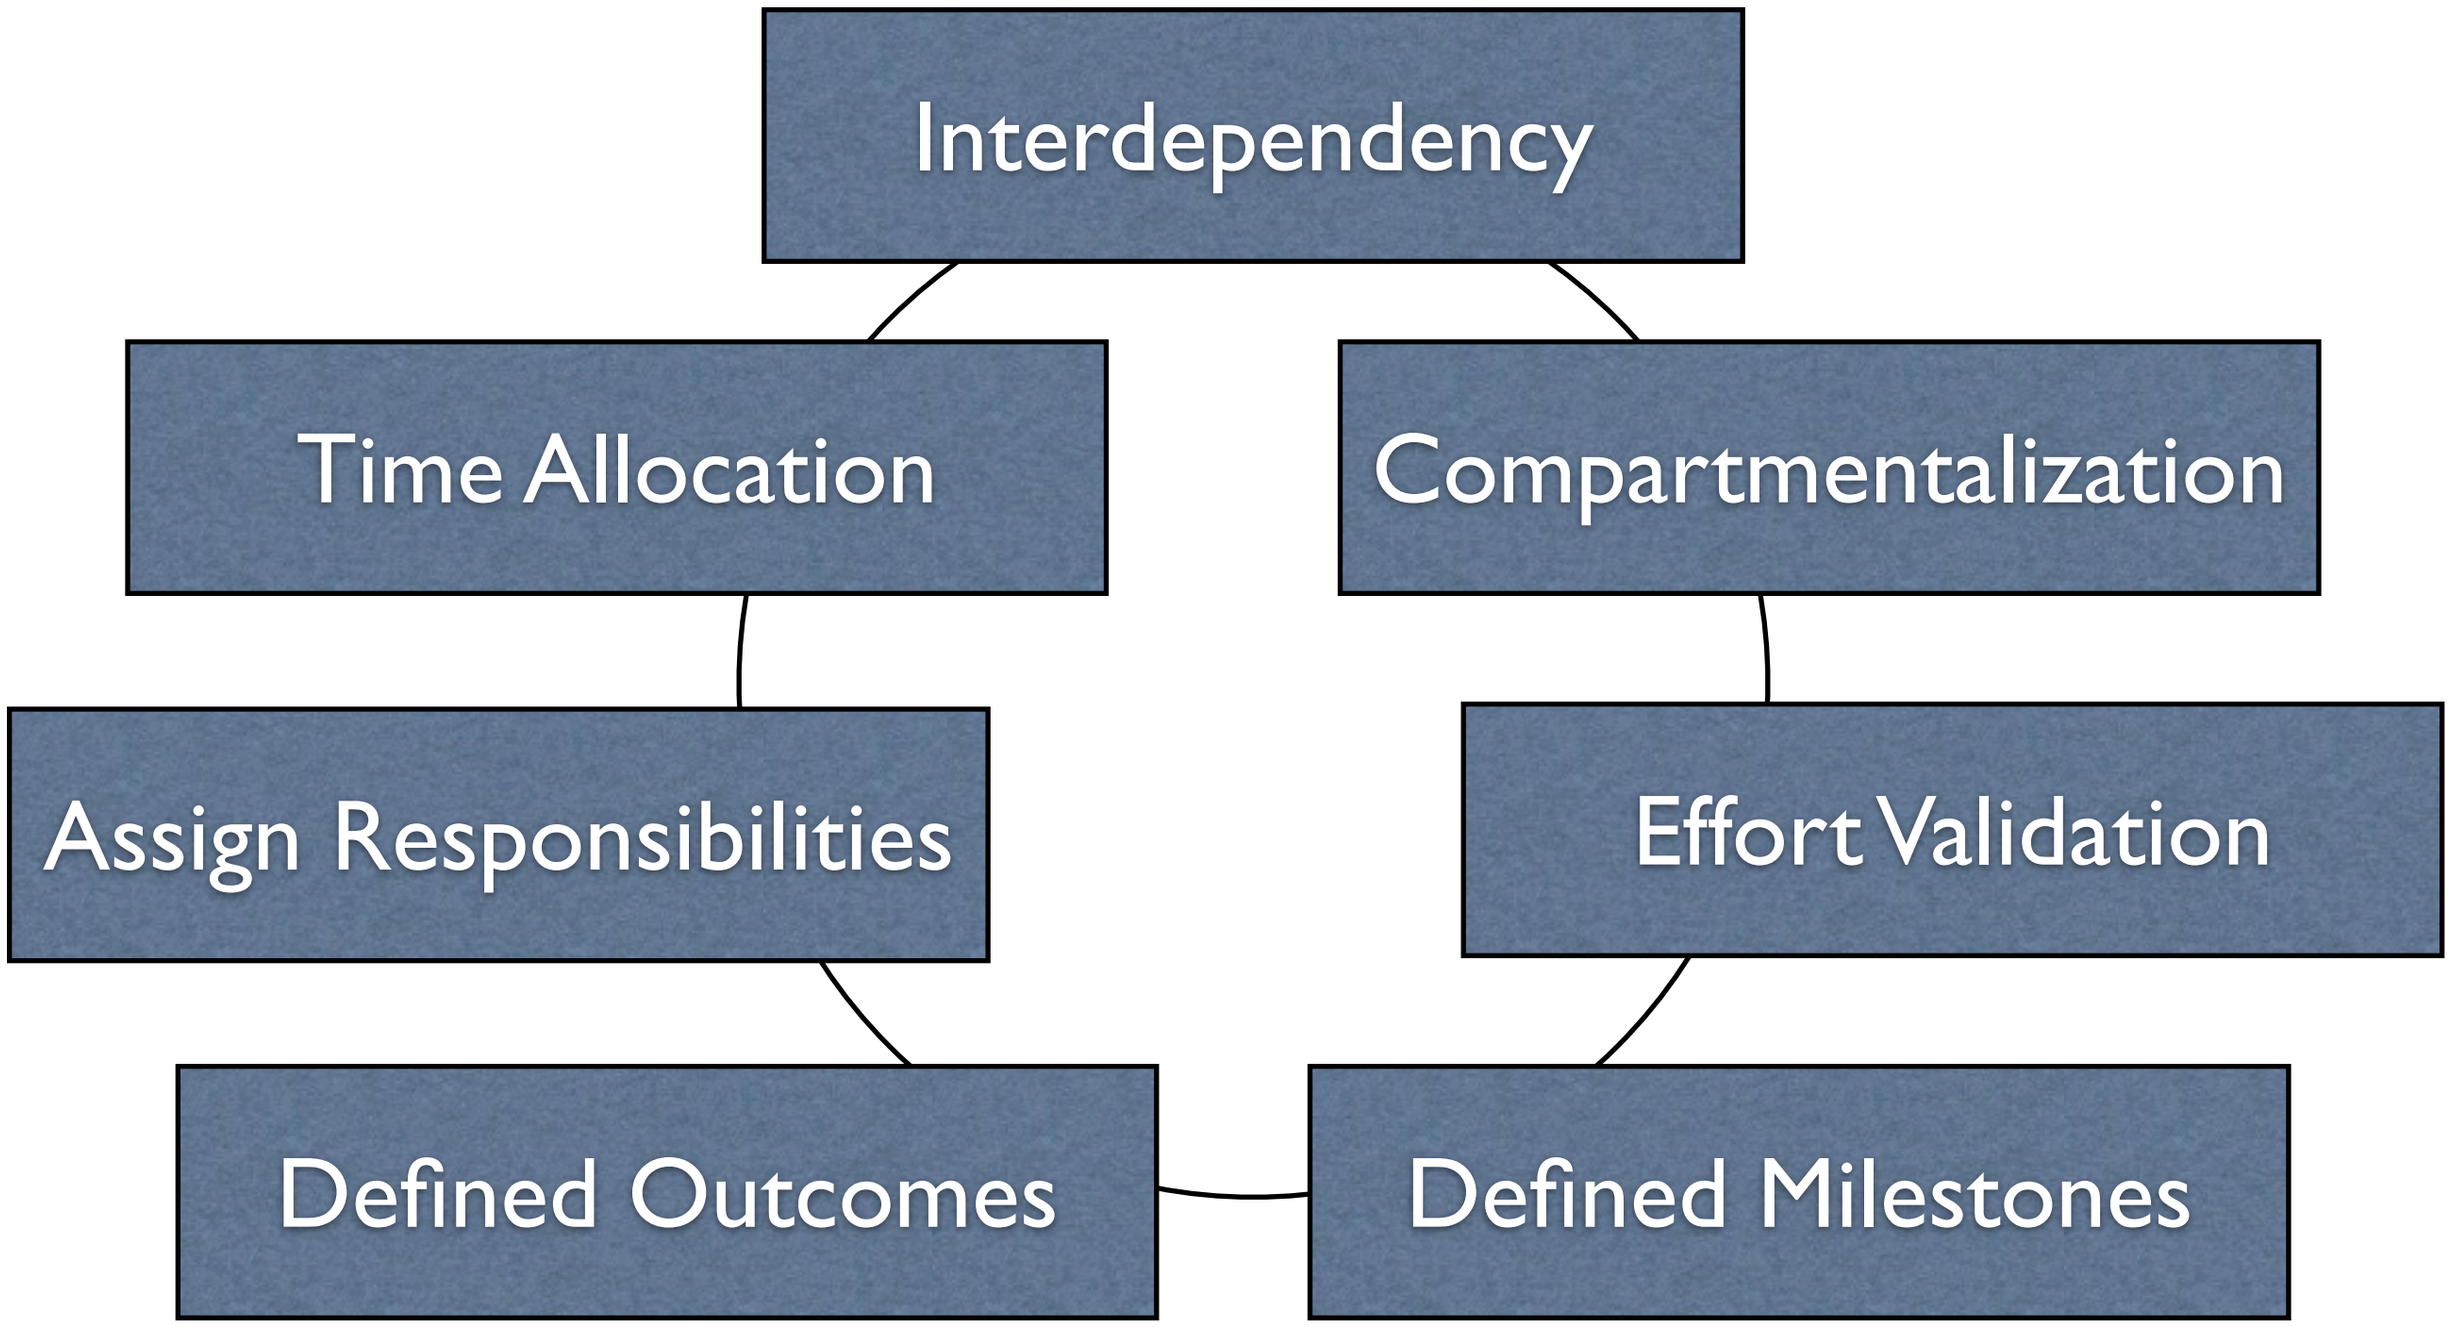
Project Scheduling

People commonly assume as will go as planned –
Each task will take as long as it ought to take.

Project Scheduling

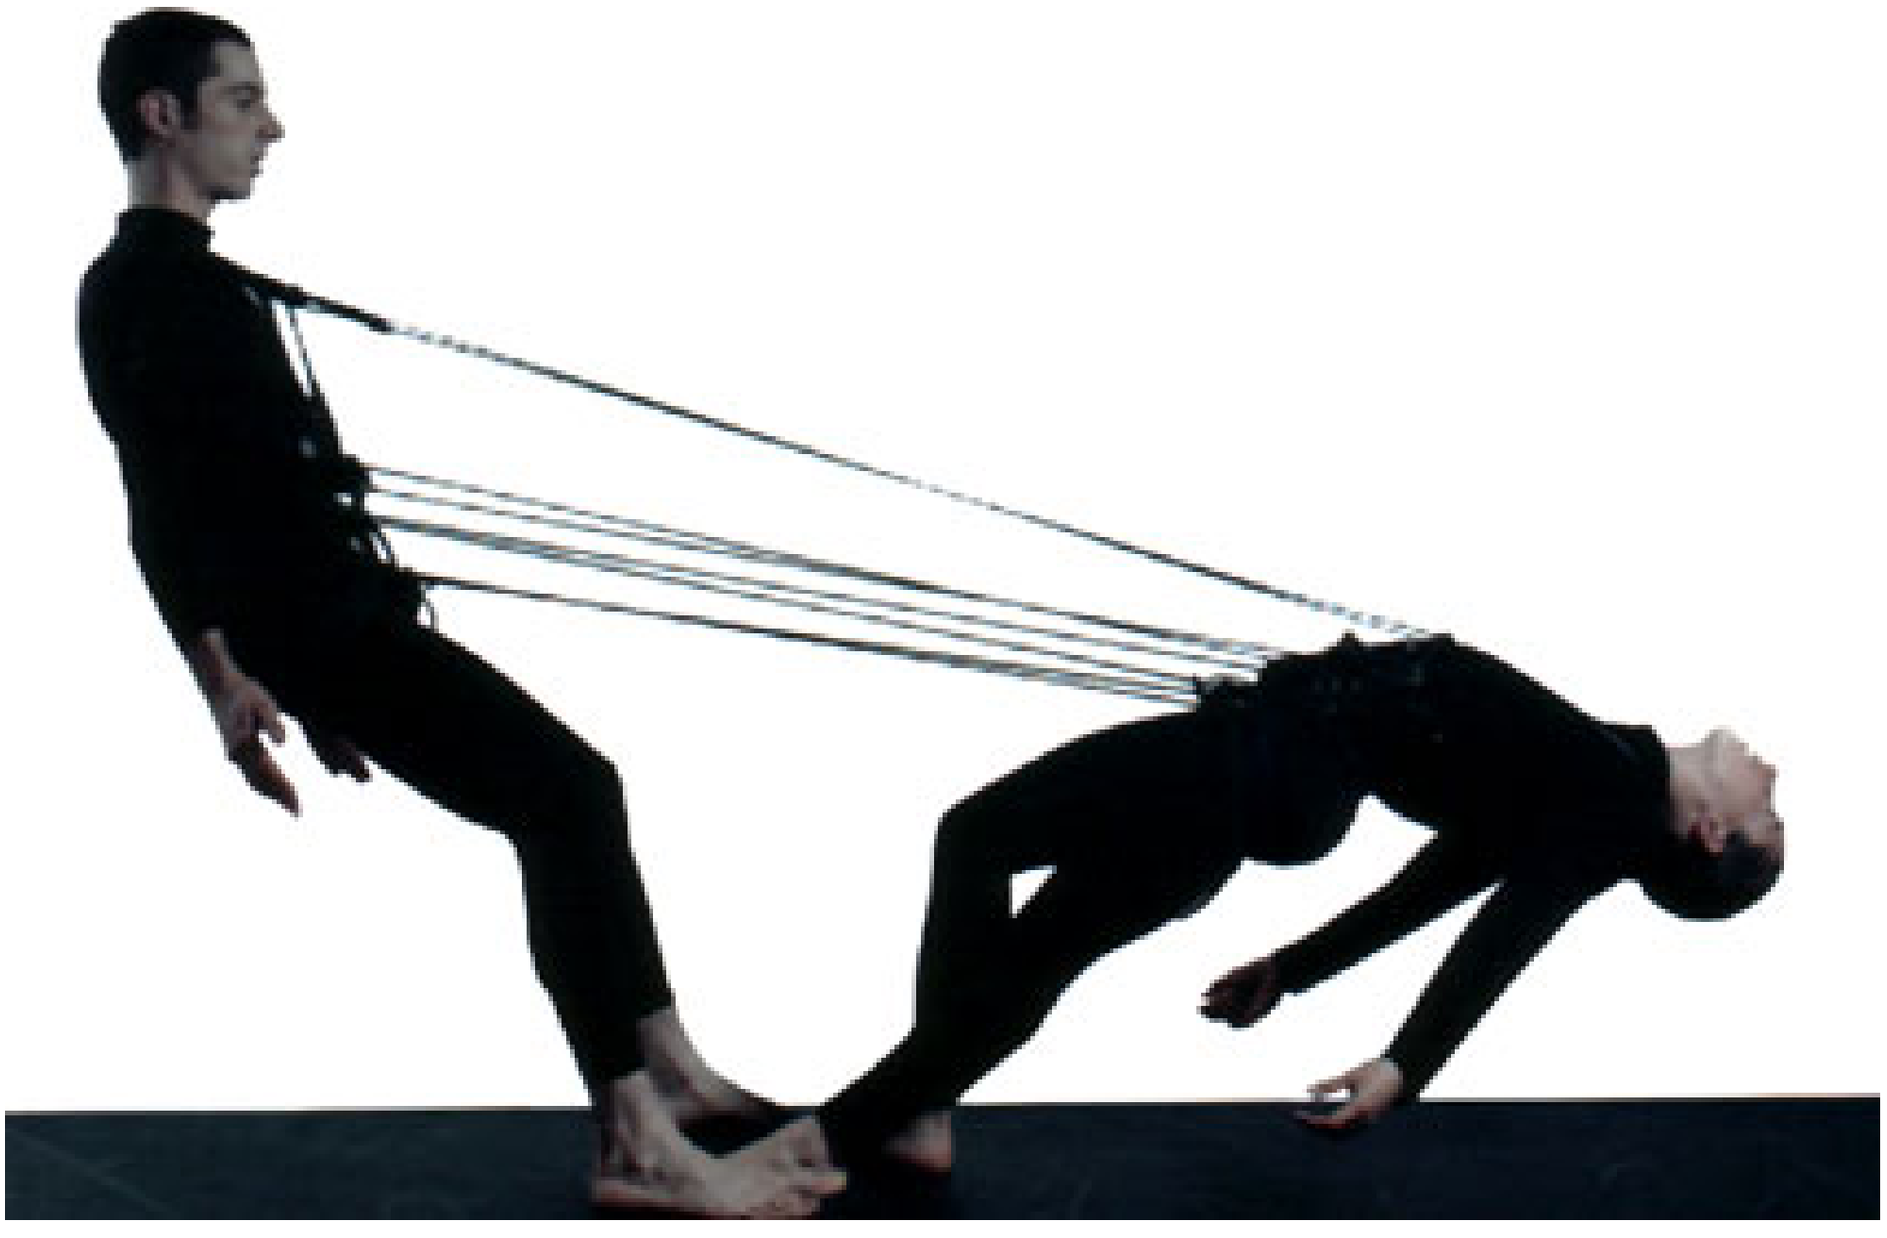


Principles of Project Scheduling



Compartmentalization

Interdependency



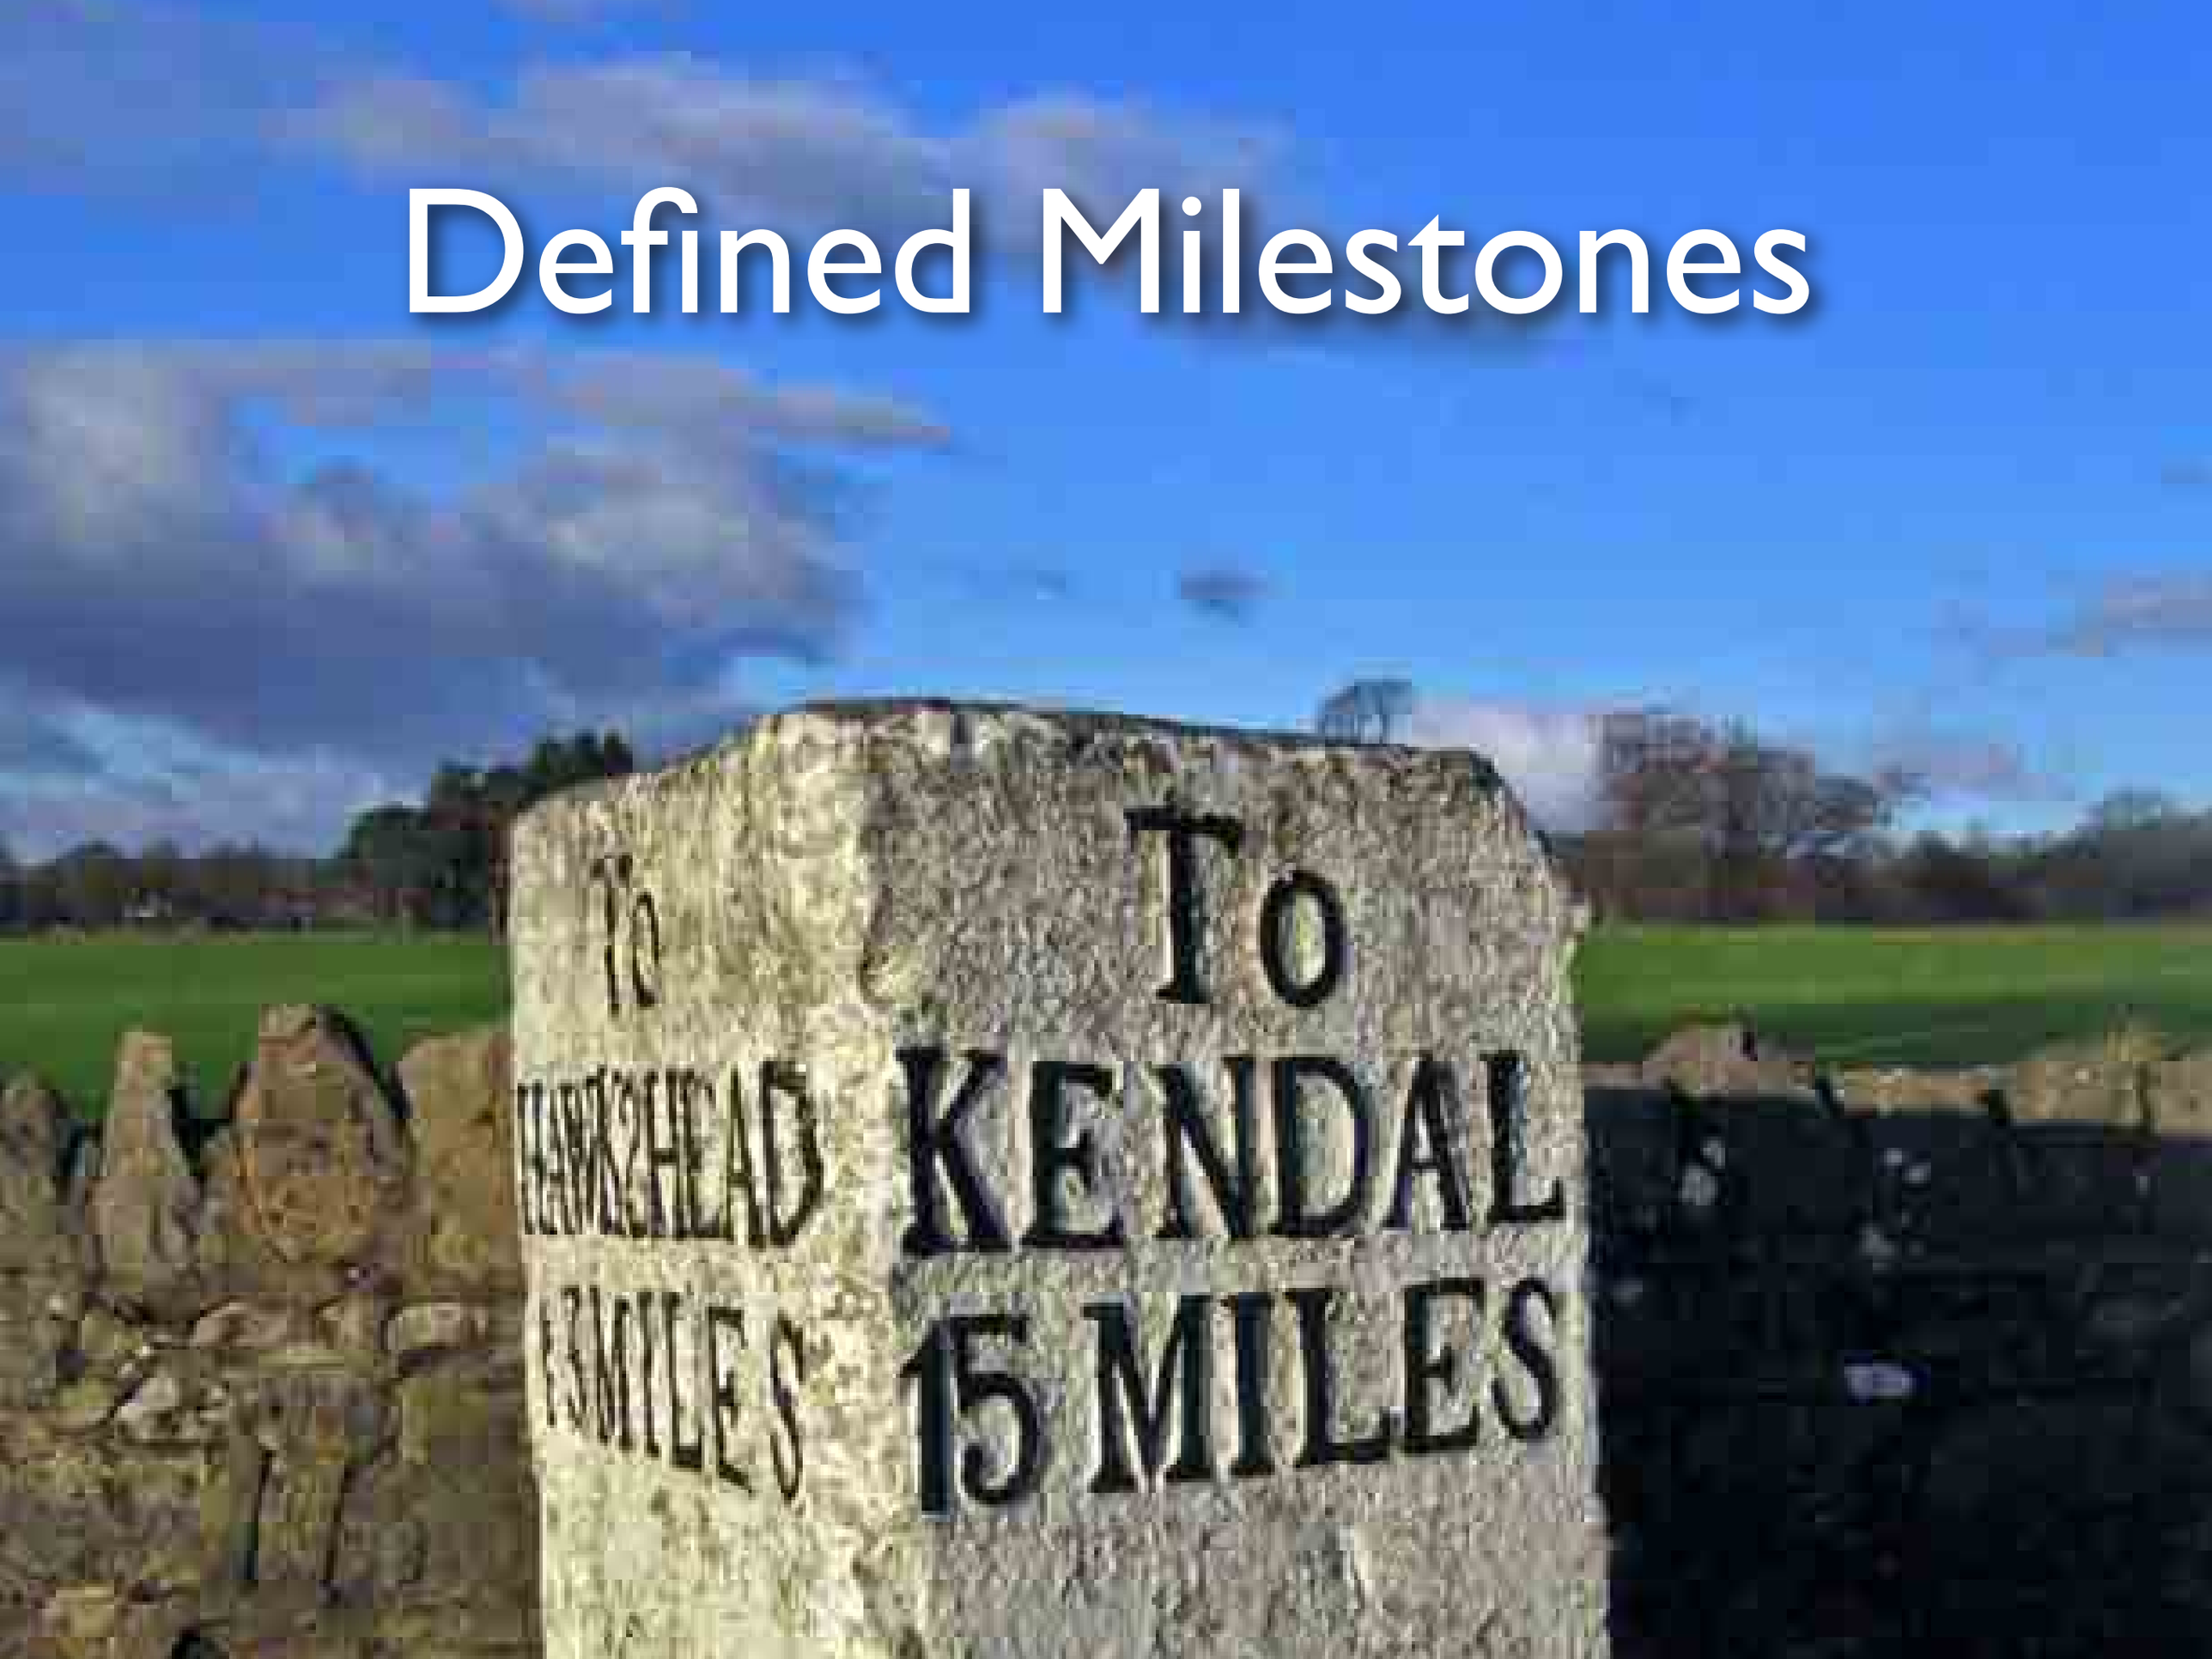
Time Allocation

Effort Validation

Assign Responsibilities

Defined Outcomes

Defined Milestones



Scheduling Tools

Compartmentalization

Work Breakdown

- Breakdown the goal of the project into several smaller, manageable goals.
- Repeat process until each goal is well understood.
- Plan for each goal individually – resource allocation, assignment, scheduling, etc.

Work Breakdown

How to build one?

Top-down Approach

Brainstorming

Work Breakdown

WBS LEVEL 1:

1. Bicycle_ 100

WBS LEVEL 2:

1. Bicycle

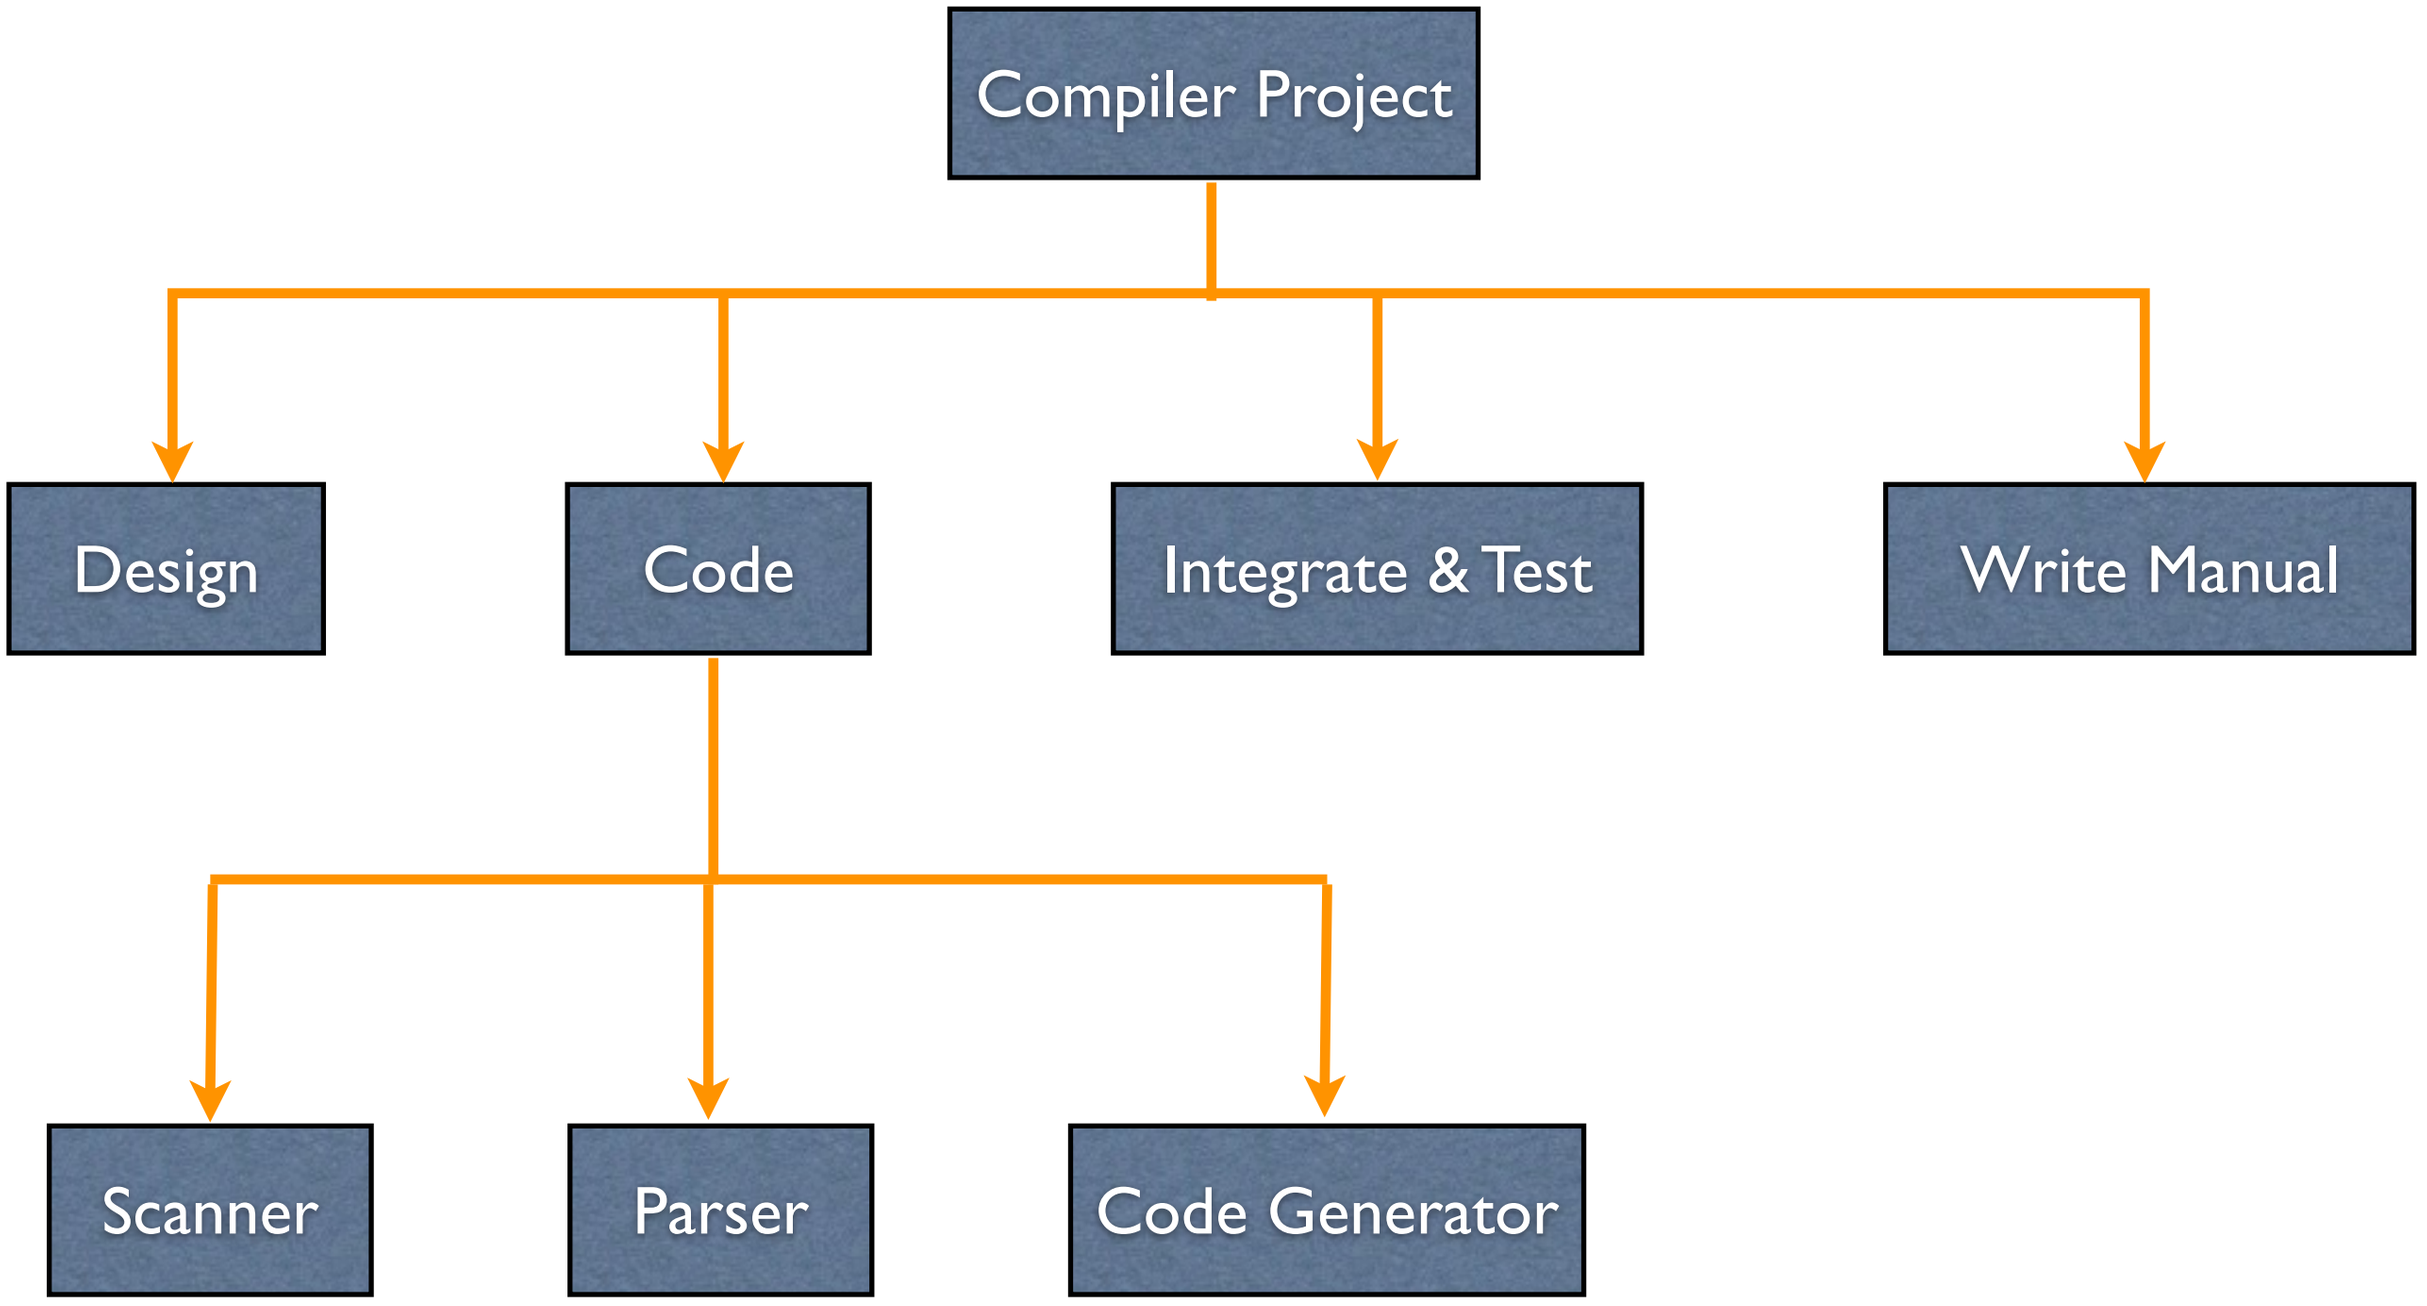
1.1 Frame Set_	15
1.2 Crank Set_	5
1.3 Wheels_	30
1.4 Braking System_	5
1.5 Shifting System_	5
1.6 Integration_	35
1.7 Project Mgt_	5
	100

WBS LEVEL 3:

1. Bicycle

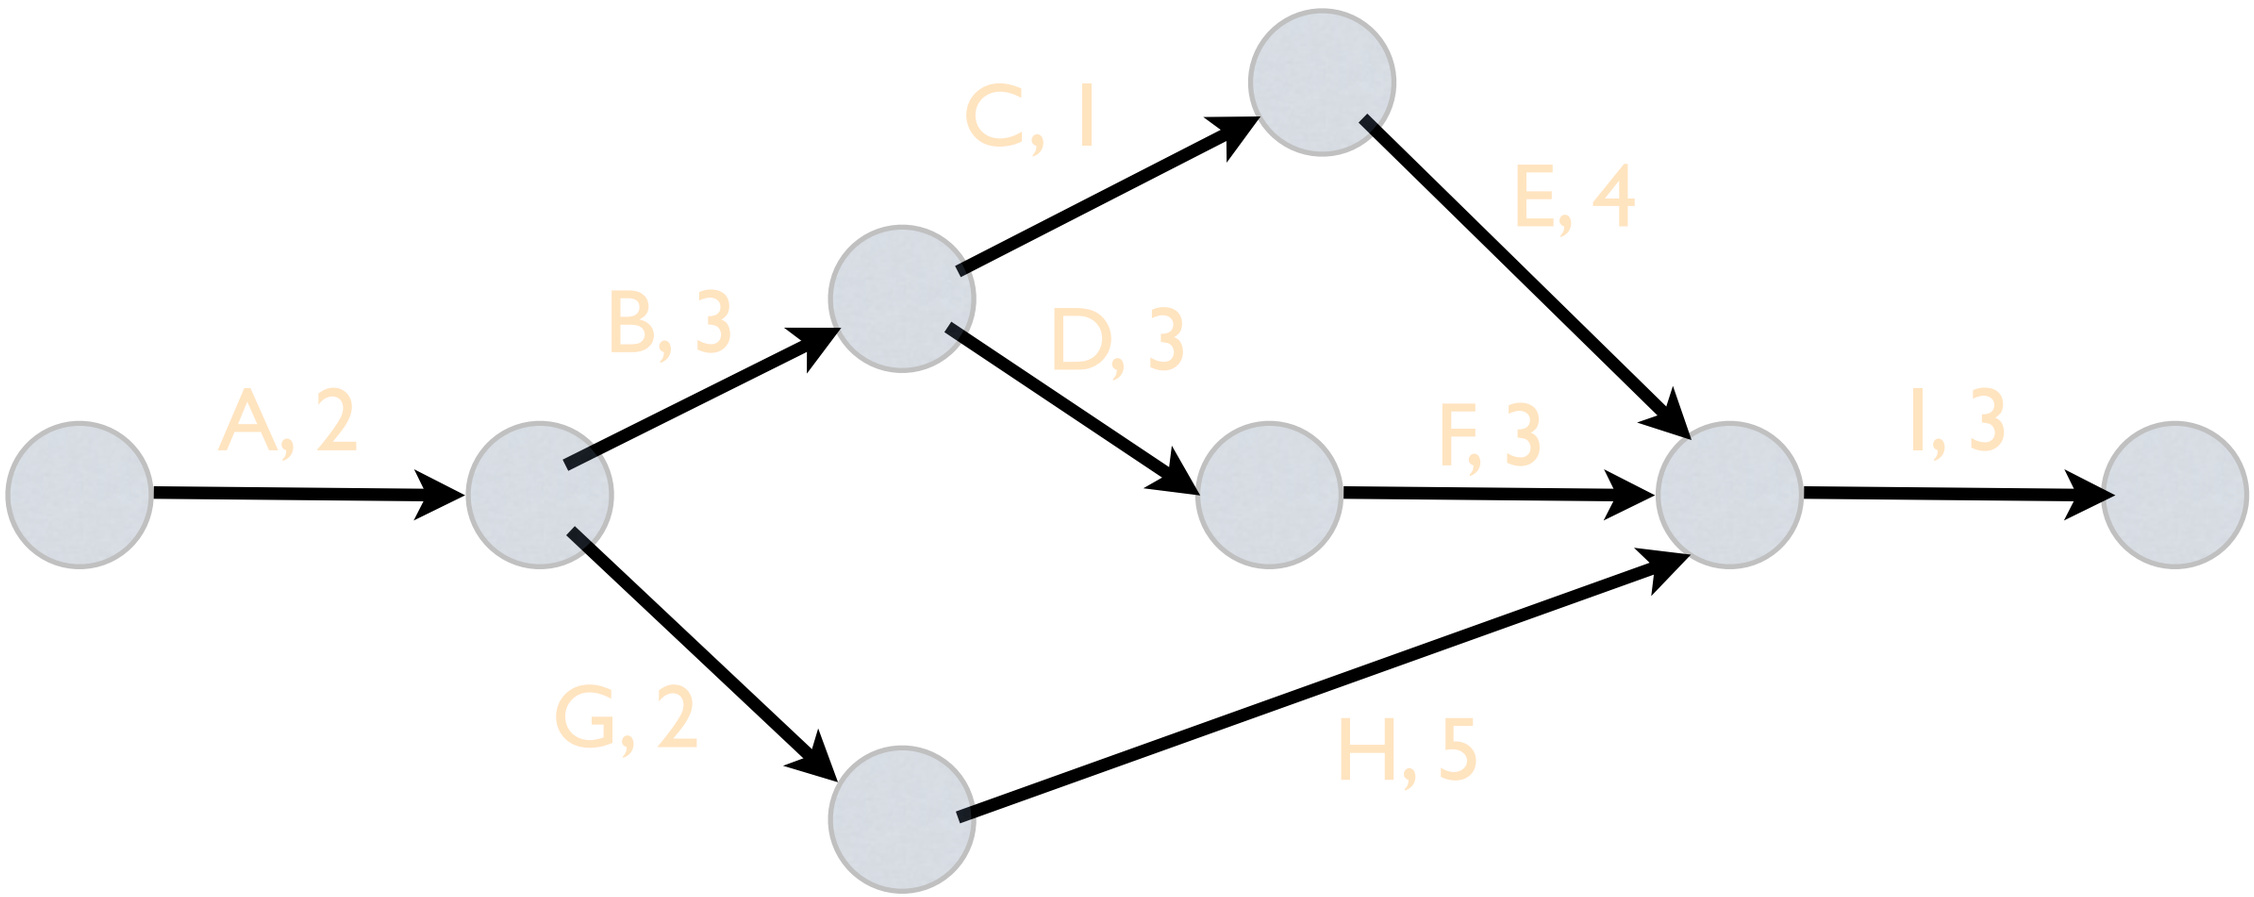
1.1 Frame Set	
1.1.1 Frame_	7
1.1.2 Handlebar_	2
1.1.3 Fork_	3
1.1.4 Seat_	3
1.2 Crank Set_	5
1.3 Wheels	
1.3.1 Front Wheel_	13
1.3.2 Rear Wheel_	17
1.4 Braking System_	5
1.5 Shifting System_	5
1.6 Integration	
1.6.1 Concept_	3
1.6.2 Design_	5
1.6.3 Assembly_	10
1.6.4 Testing_	17
1.7 Project Mgt_	5
	100

Work Breakdown



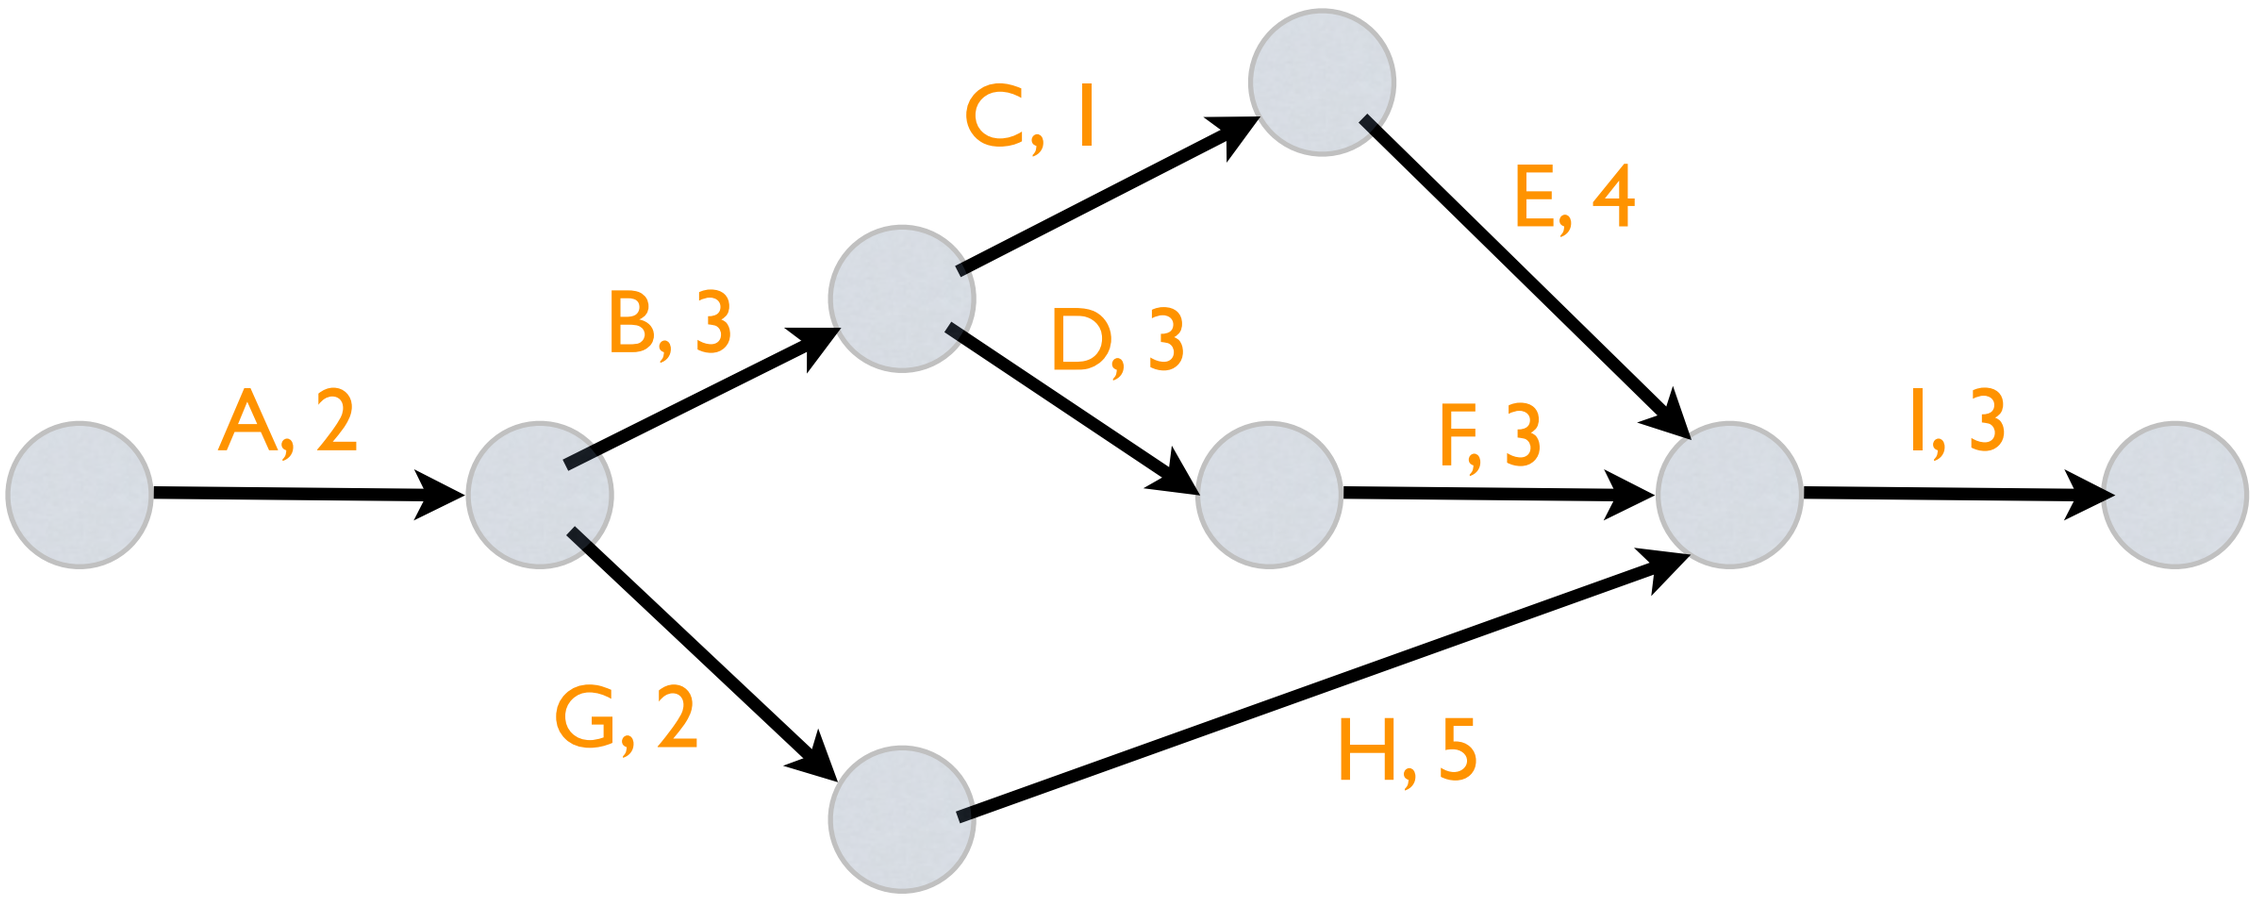
Critical Path Method

Arrows indicate tasks



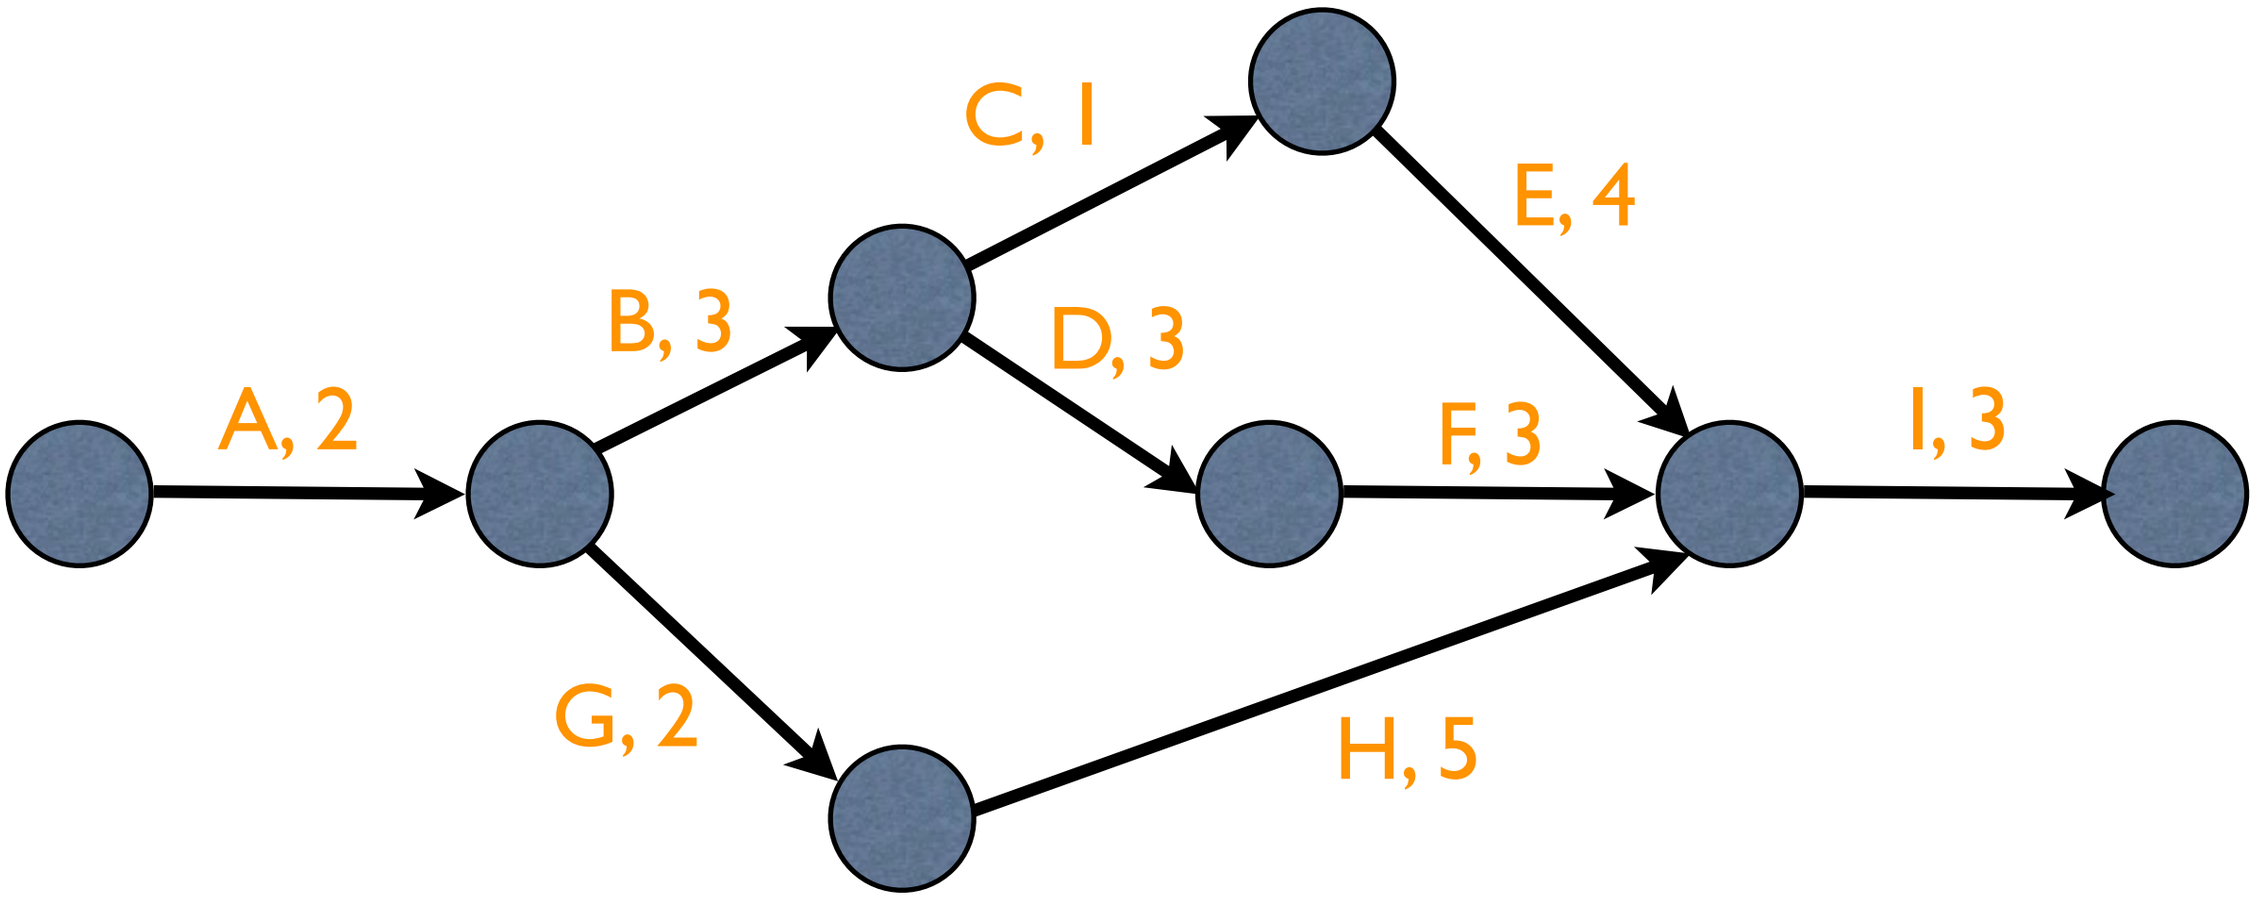
Critical Path Method

Labels indicate task name and duration



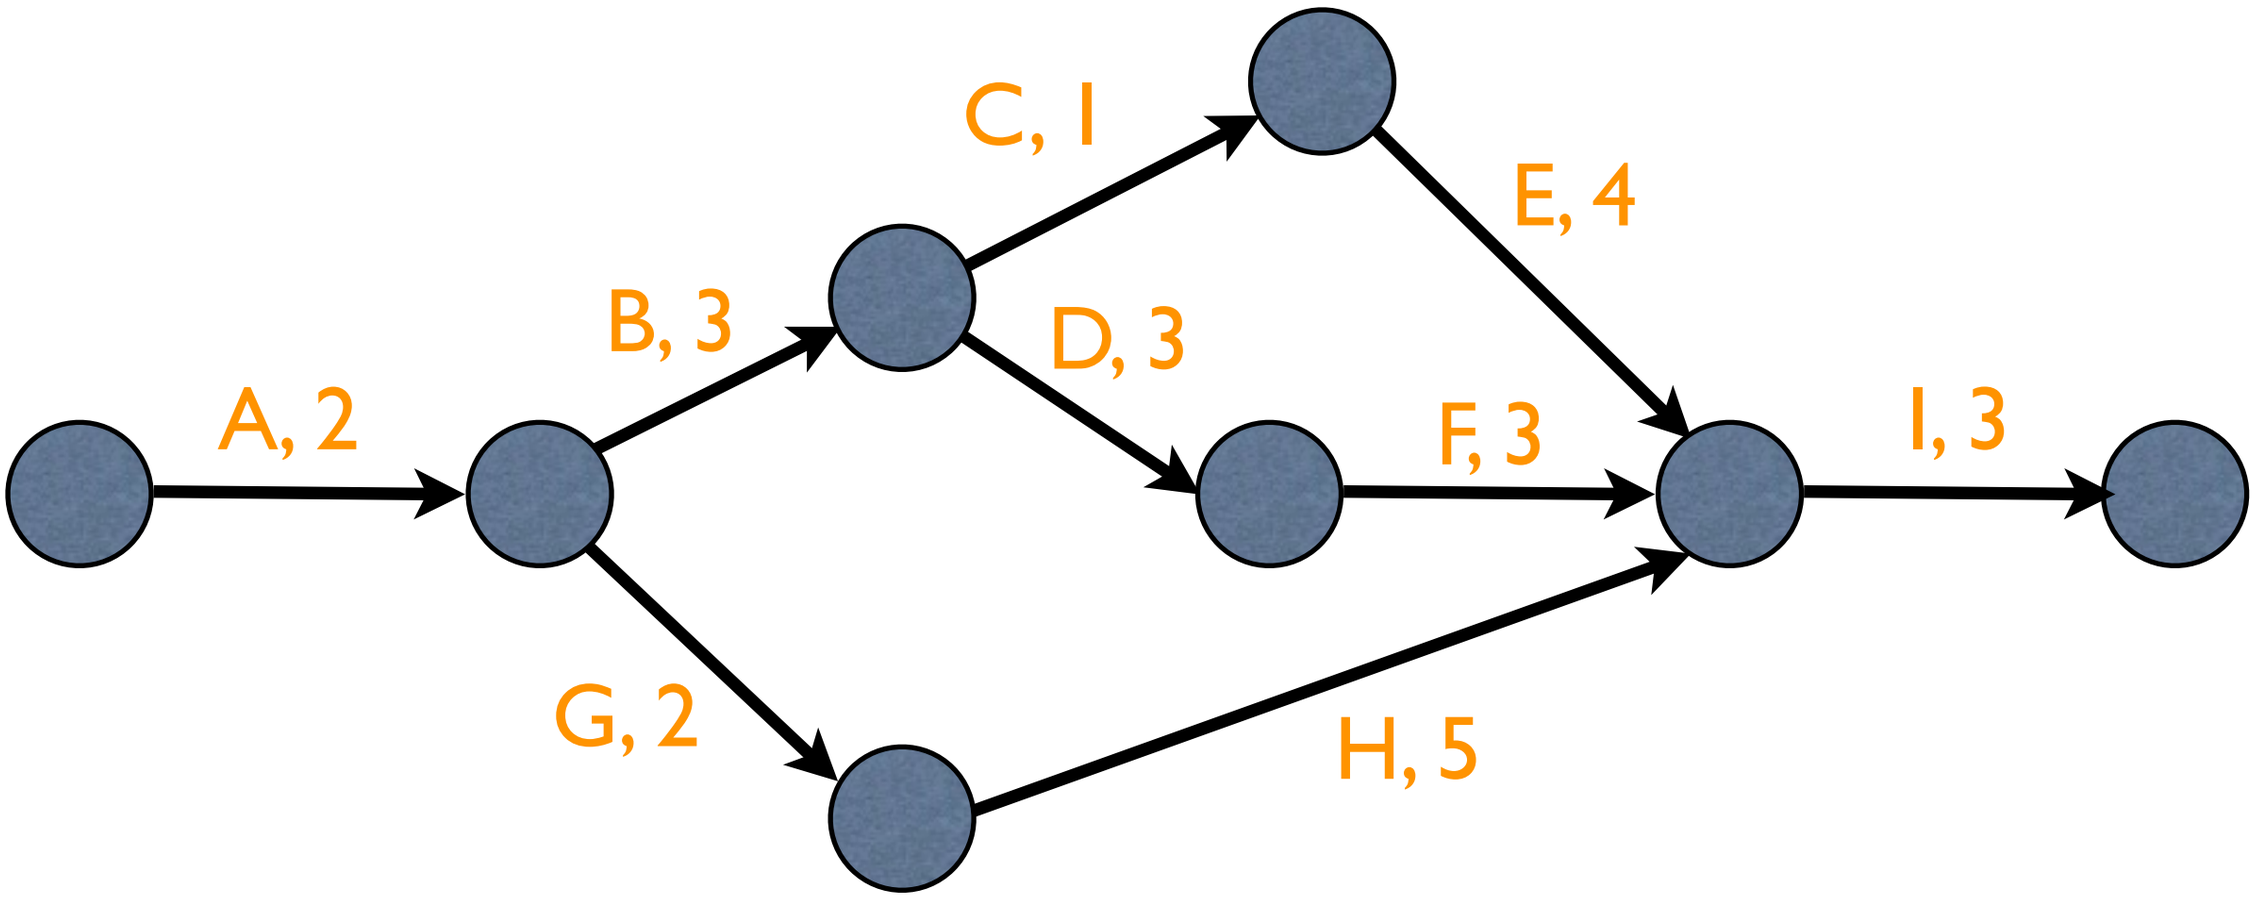
Critical Path Method

Nodes indicate the start and end points of tasks.



Critical Path Method

Partial order between edges capture project dependency



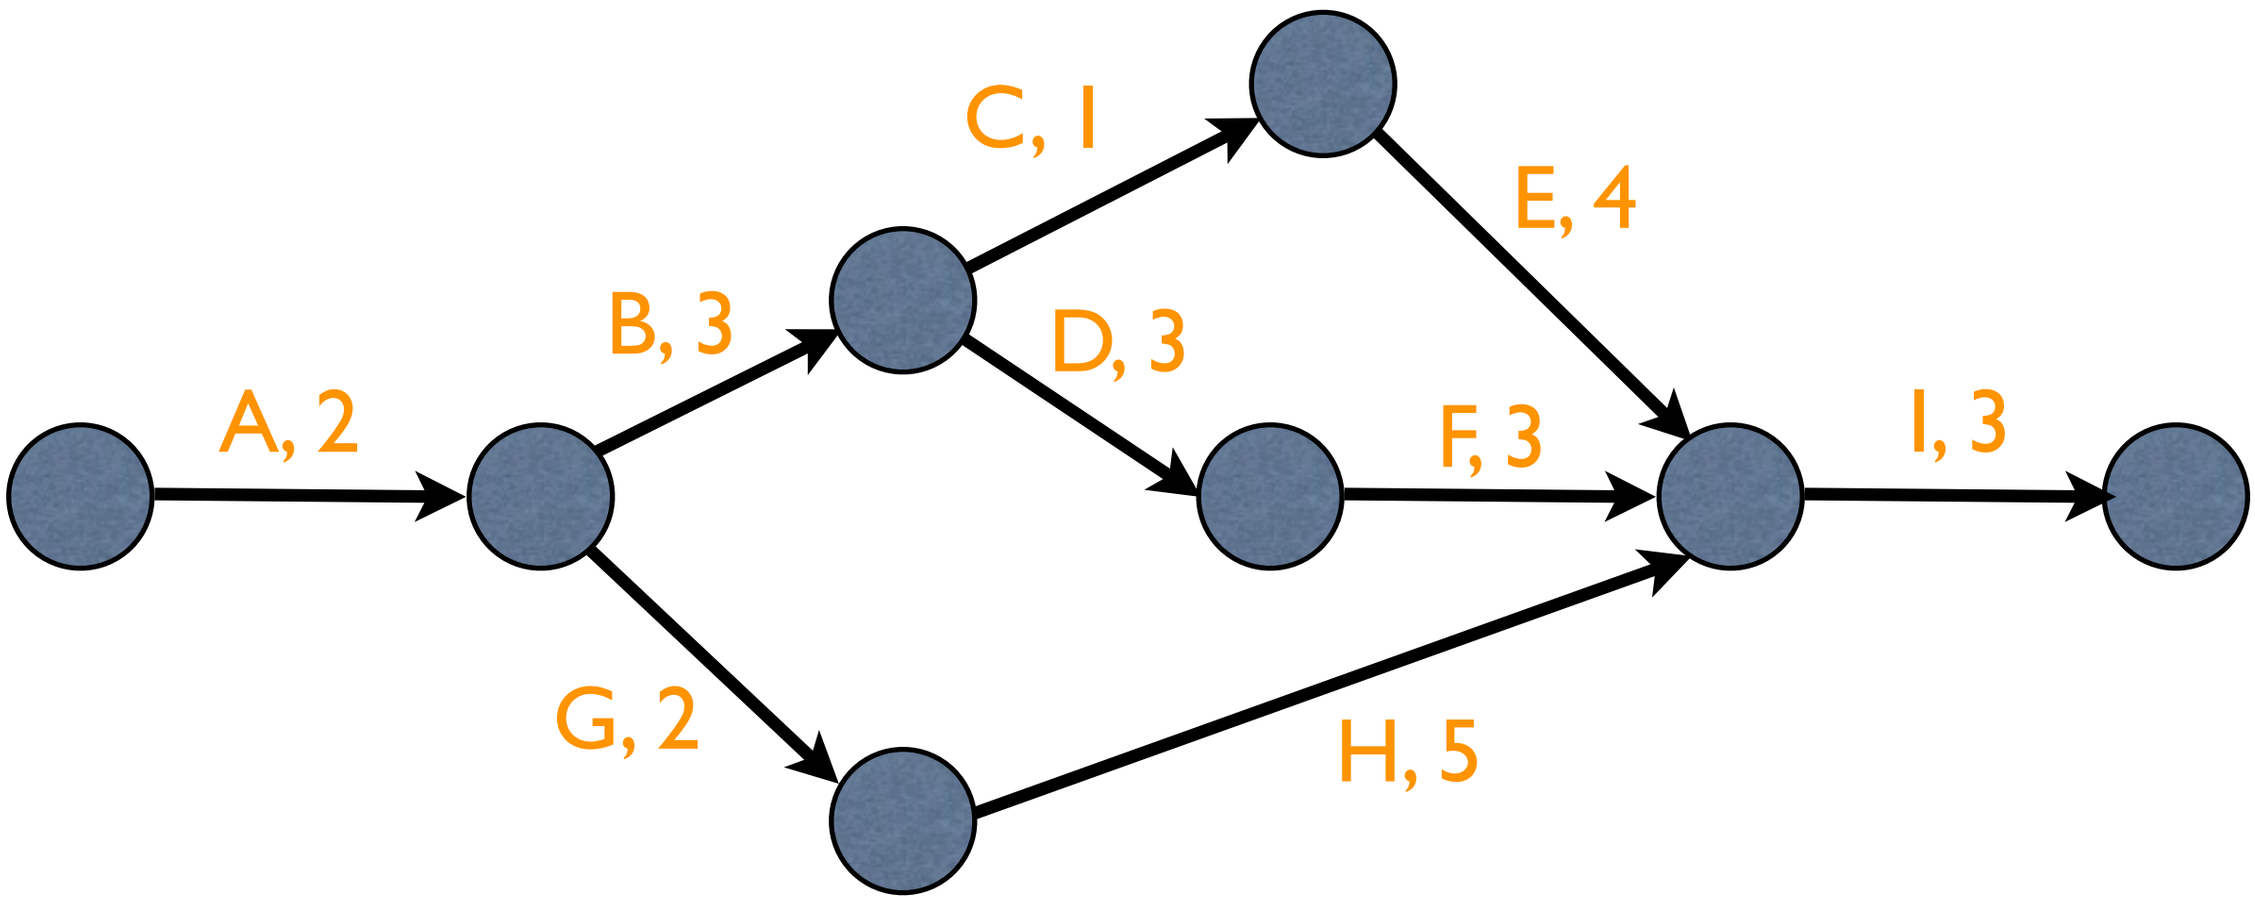
Critical Path Method

- Critical path
  - One specific sequence of dependency
    - *Unit testing cannot start before development*
    - Draws upon pre-requisite of the project

- The critical path is the sequence of activities that takes the *longest time to complete*.

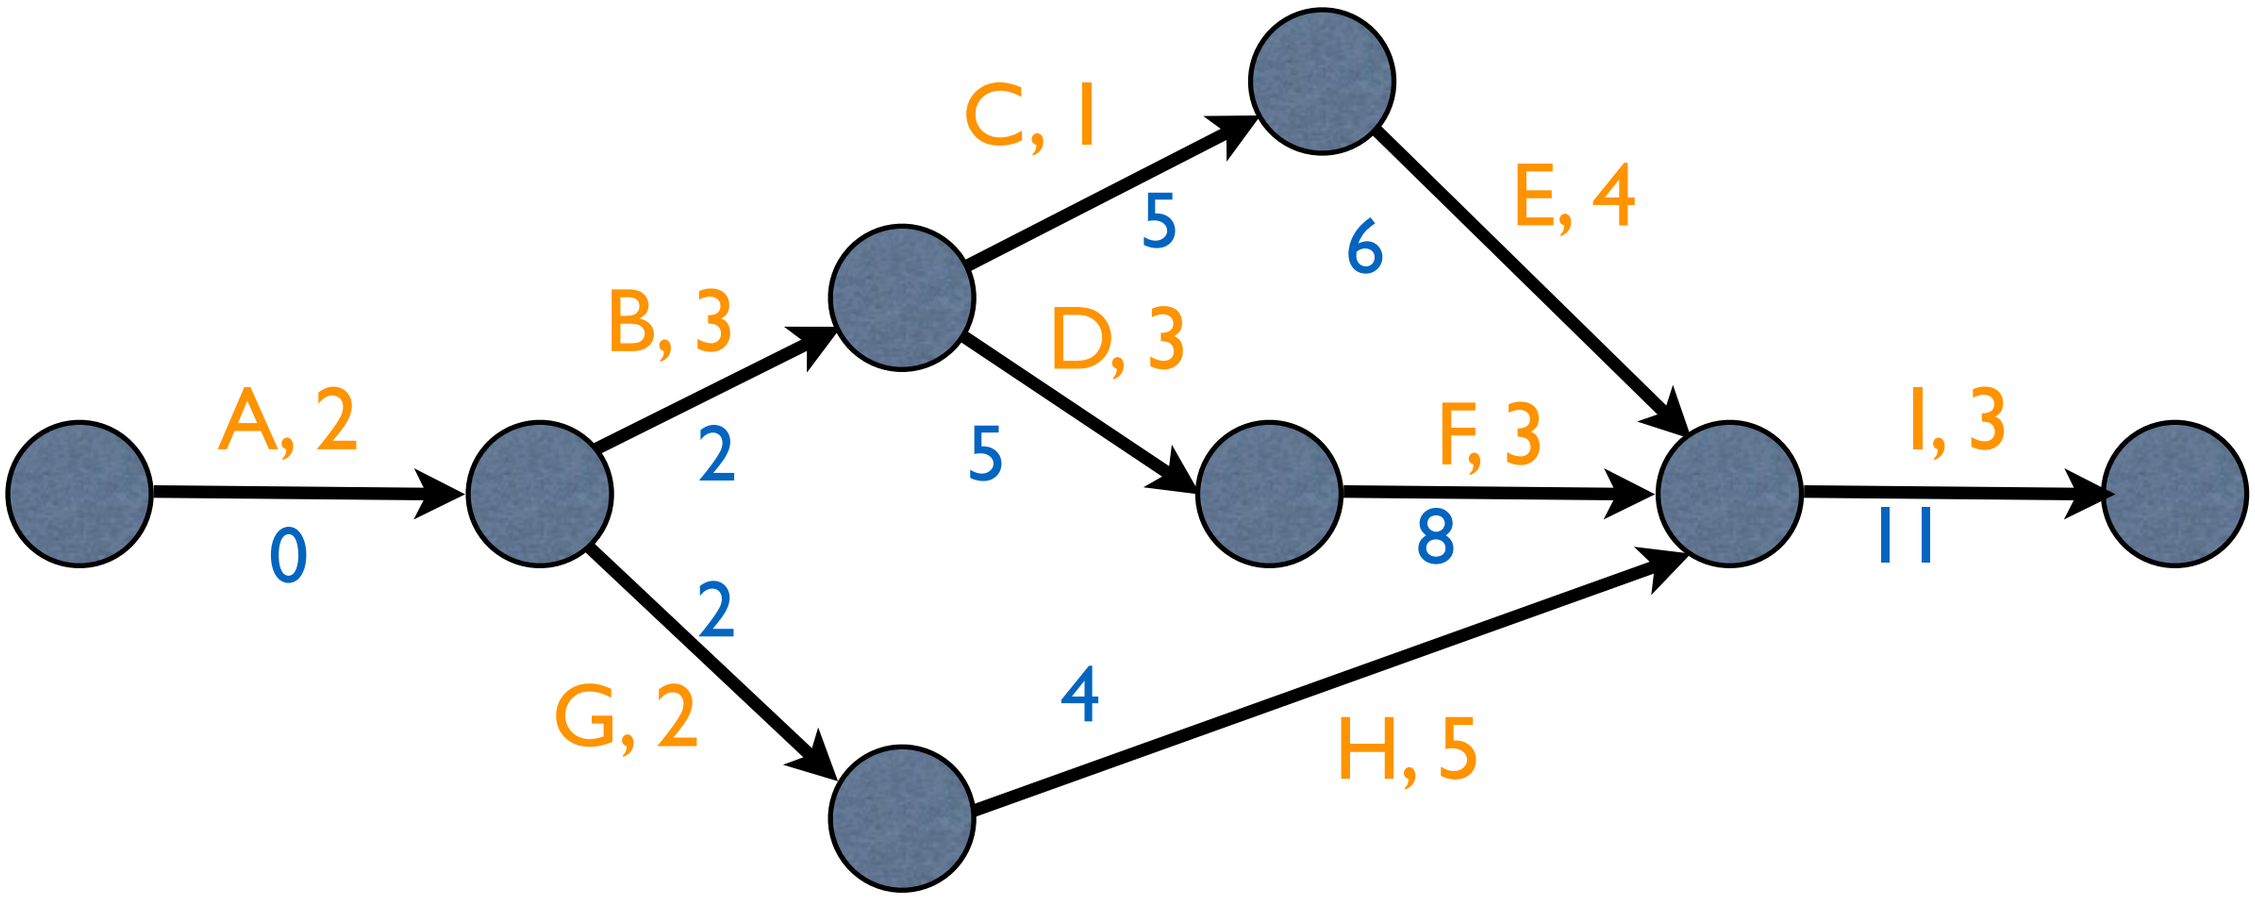
Critical Path Method (CPM)

Critical path is the sequence of activities that takes the longest time to complete



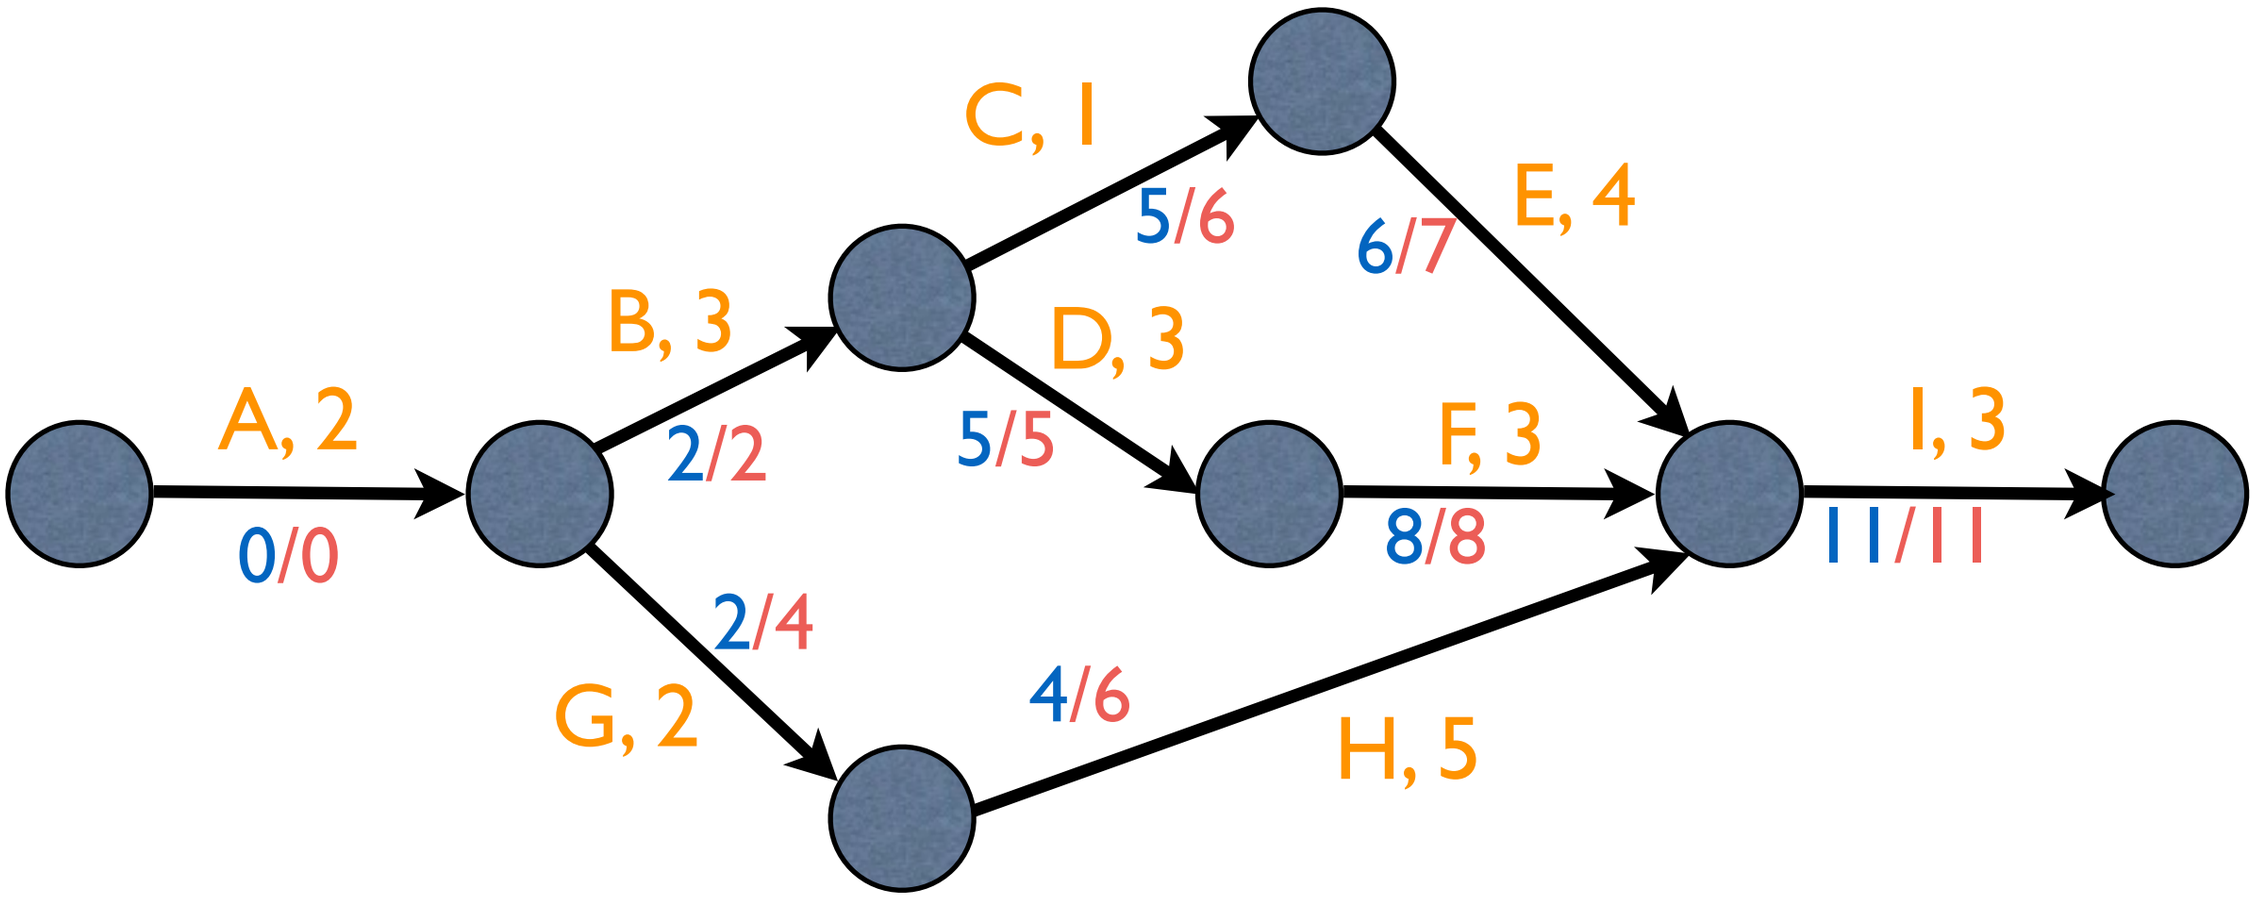
Critical Path Method

Determine Earliest Start Time



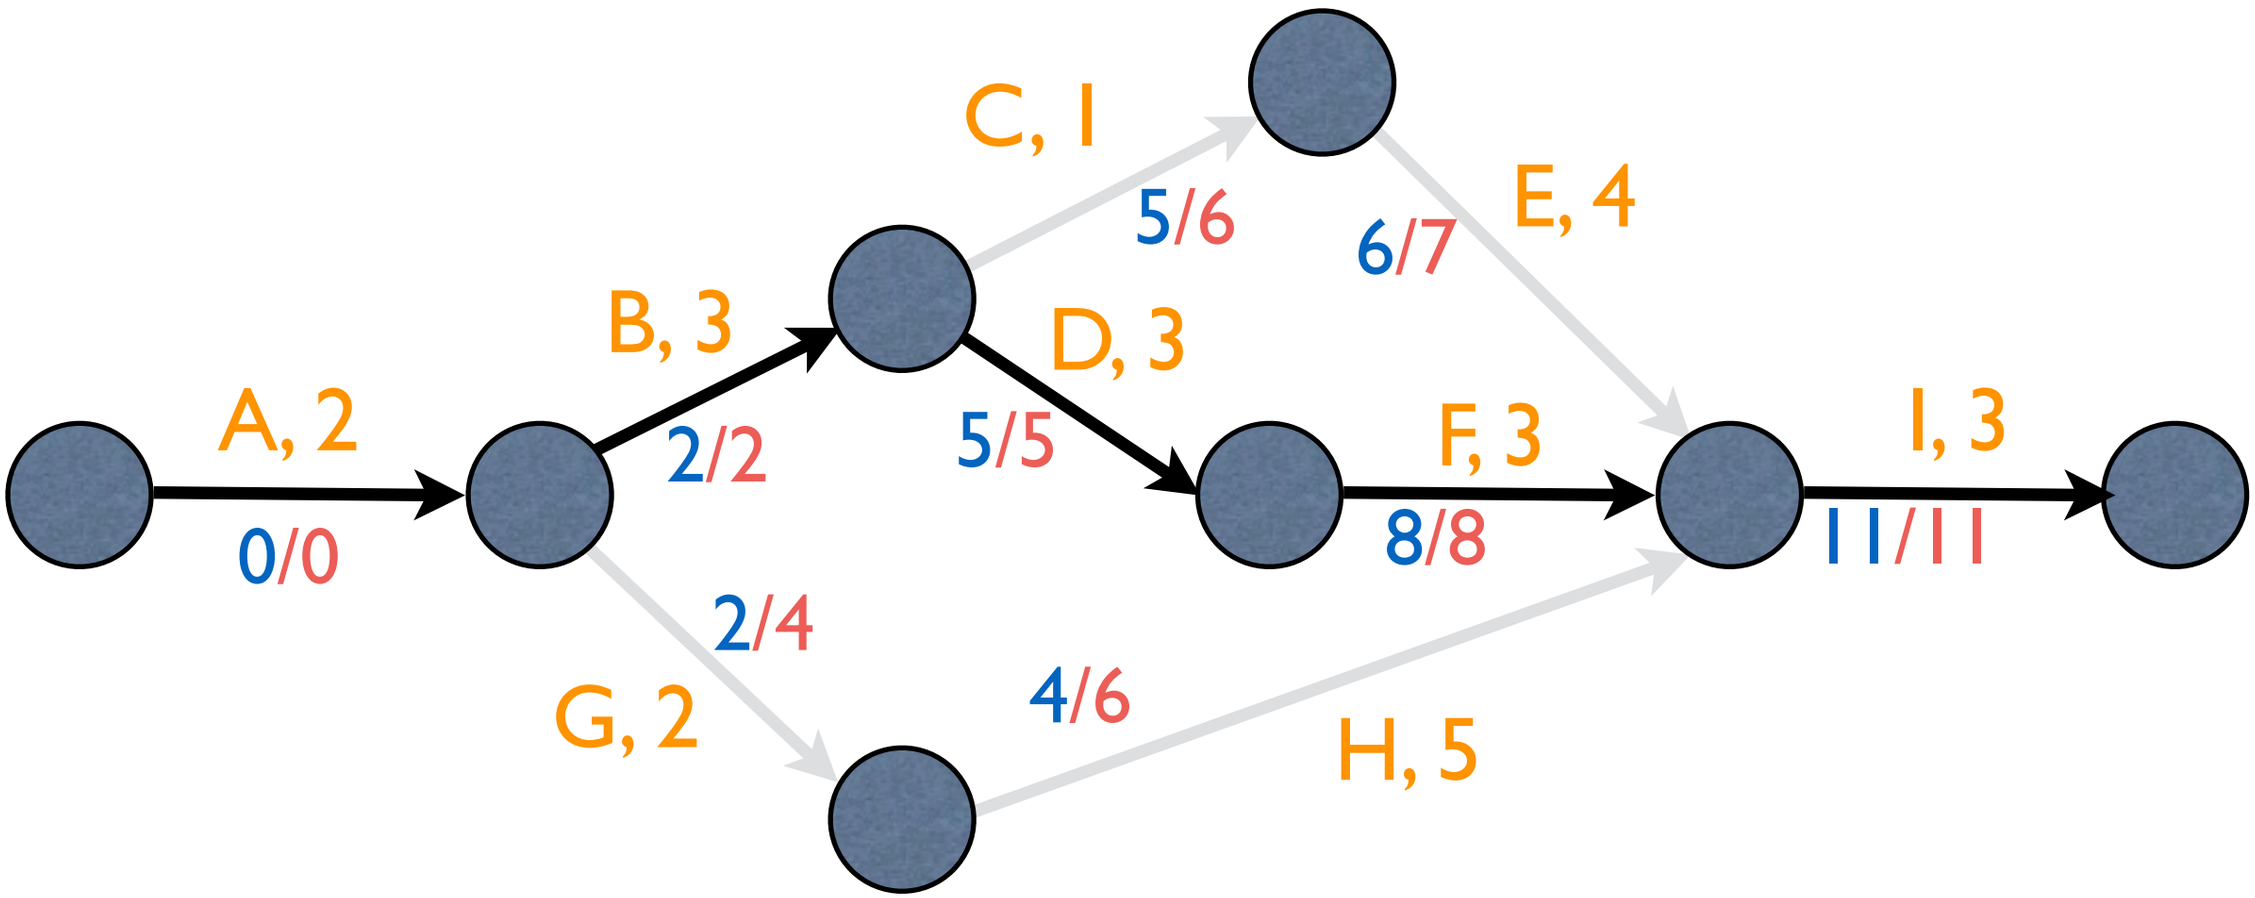
Critical Path Method

Determine Latest Start Time



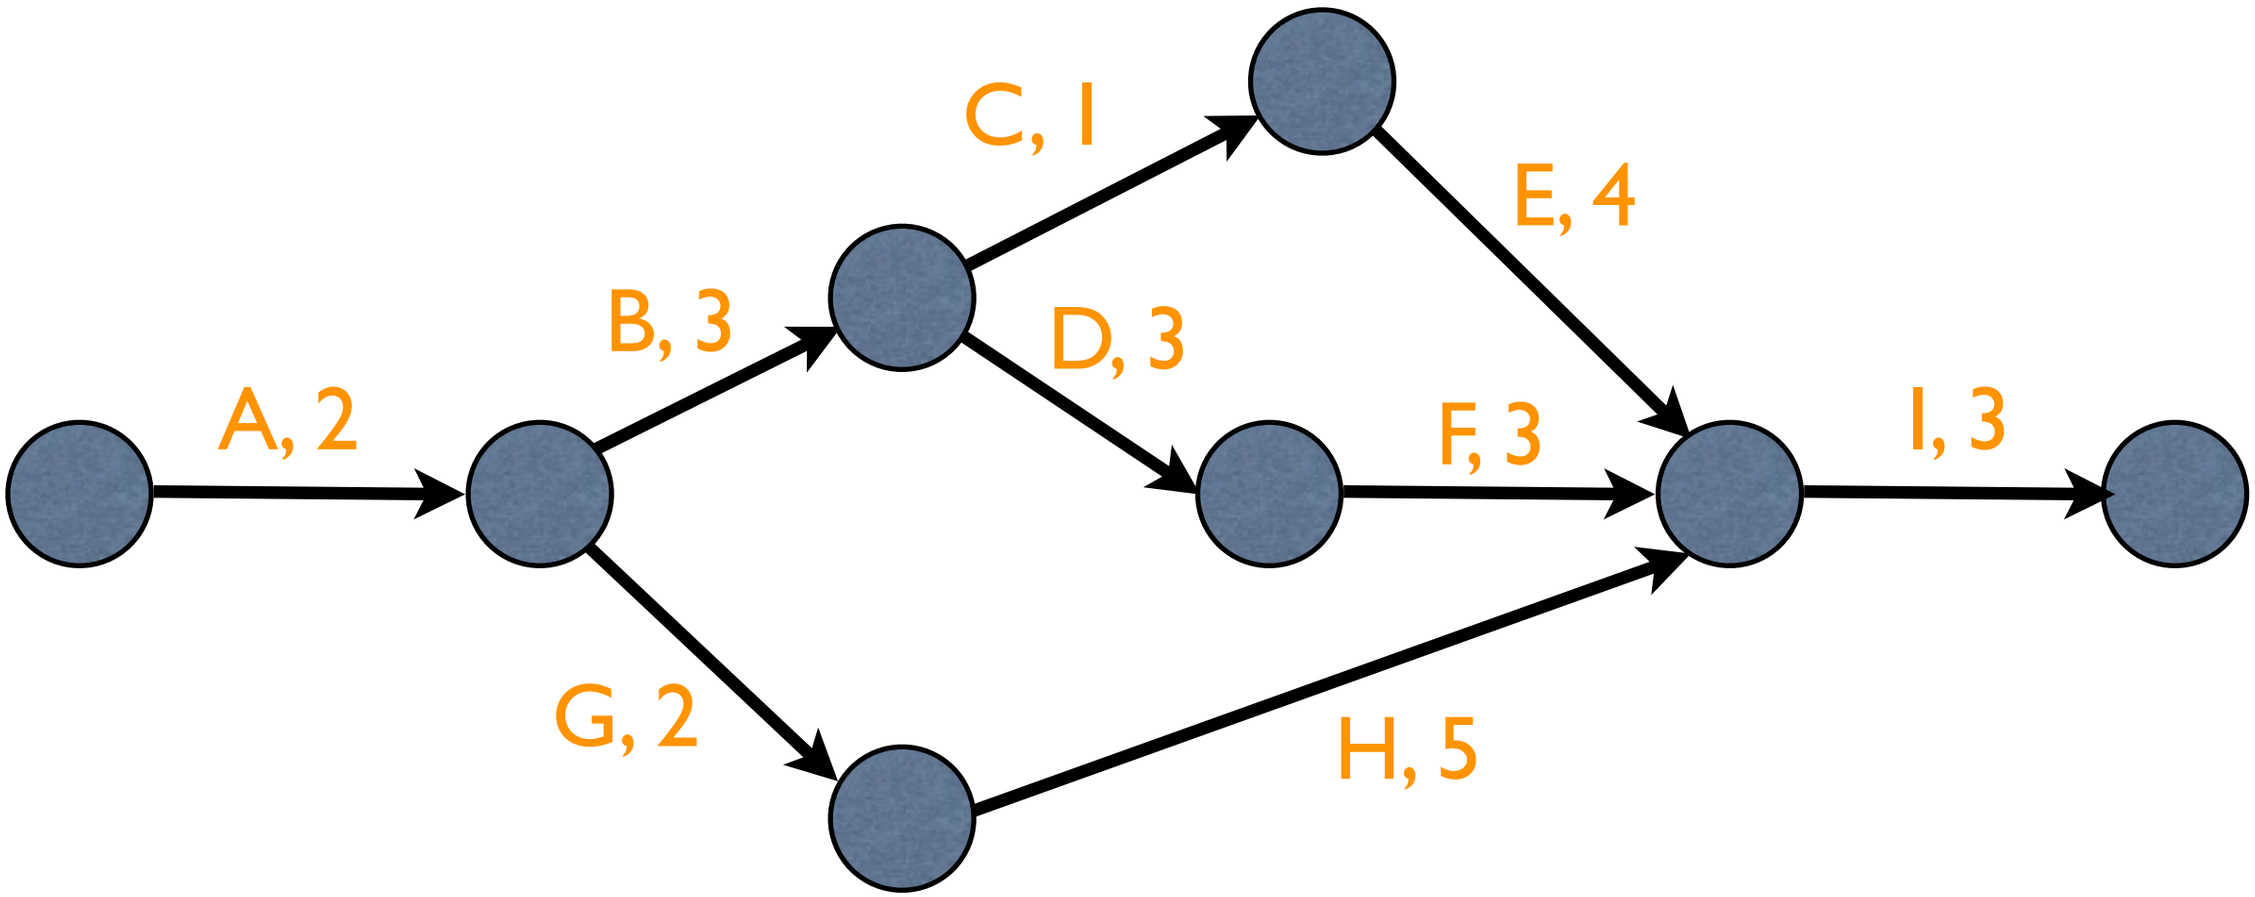
Critical Path Method

Critical path has zero slack (can you prove it?)



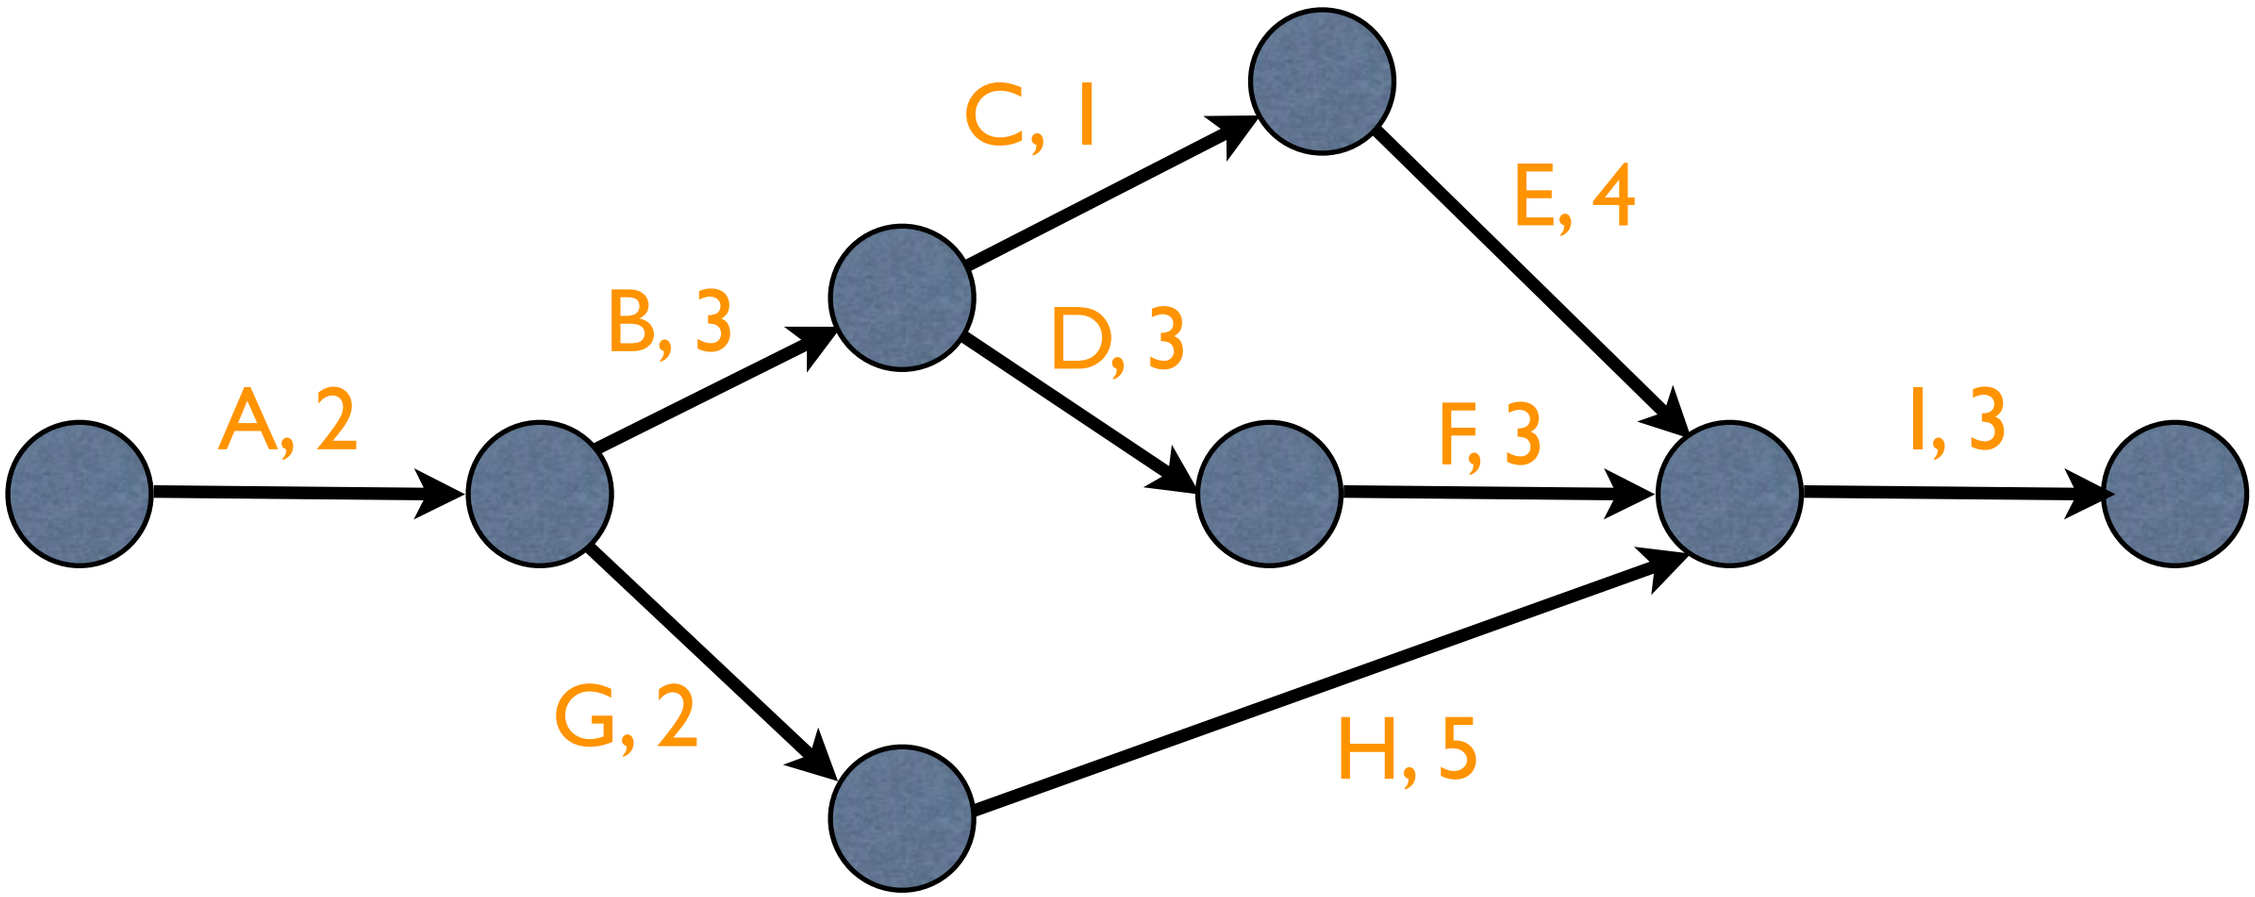
PERT Charts

PERT: Program Evaluation and Review Techniques



PERT Charts

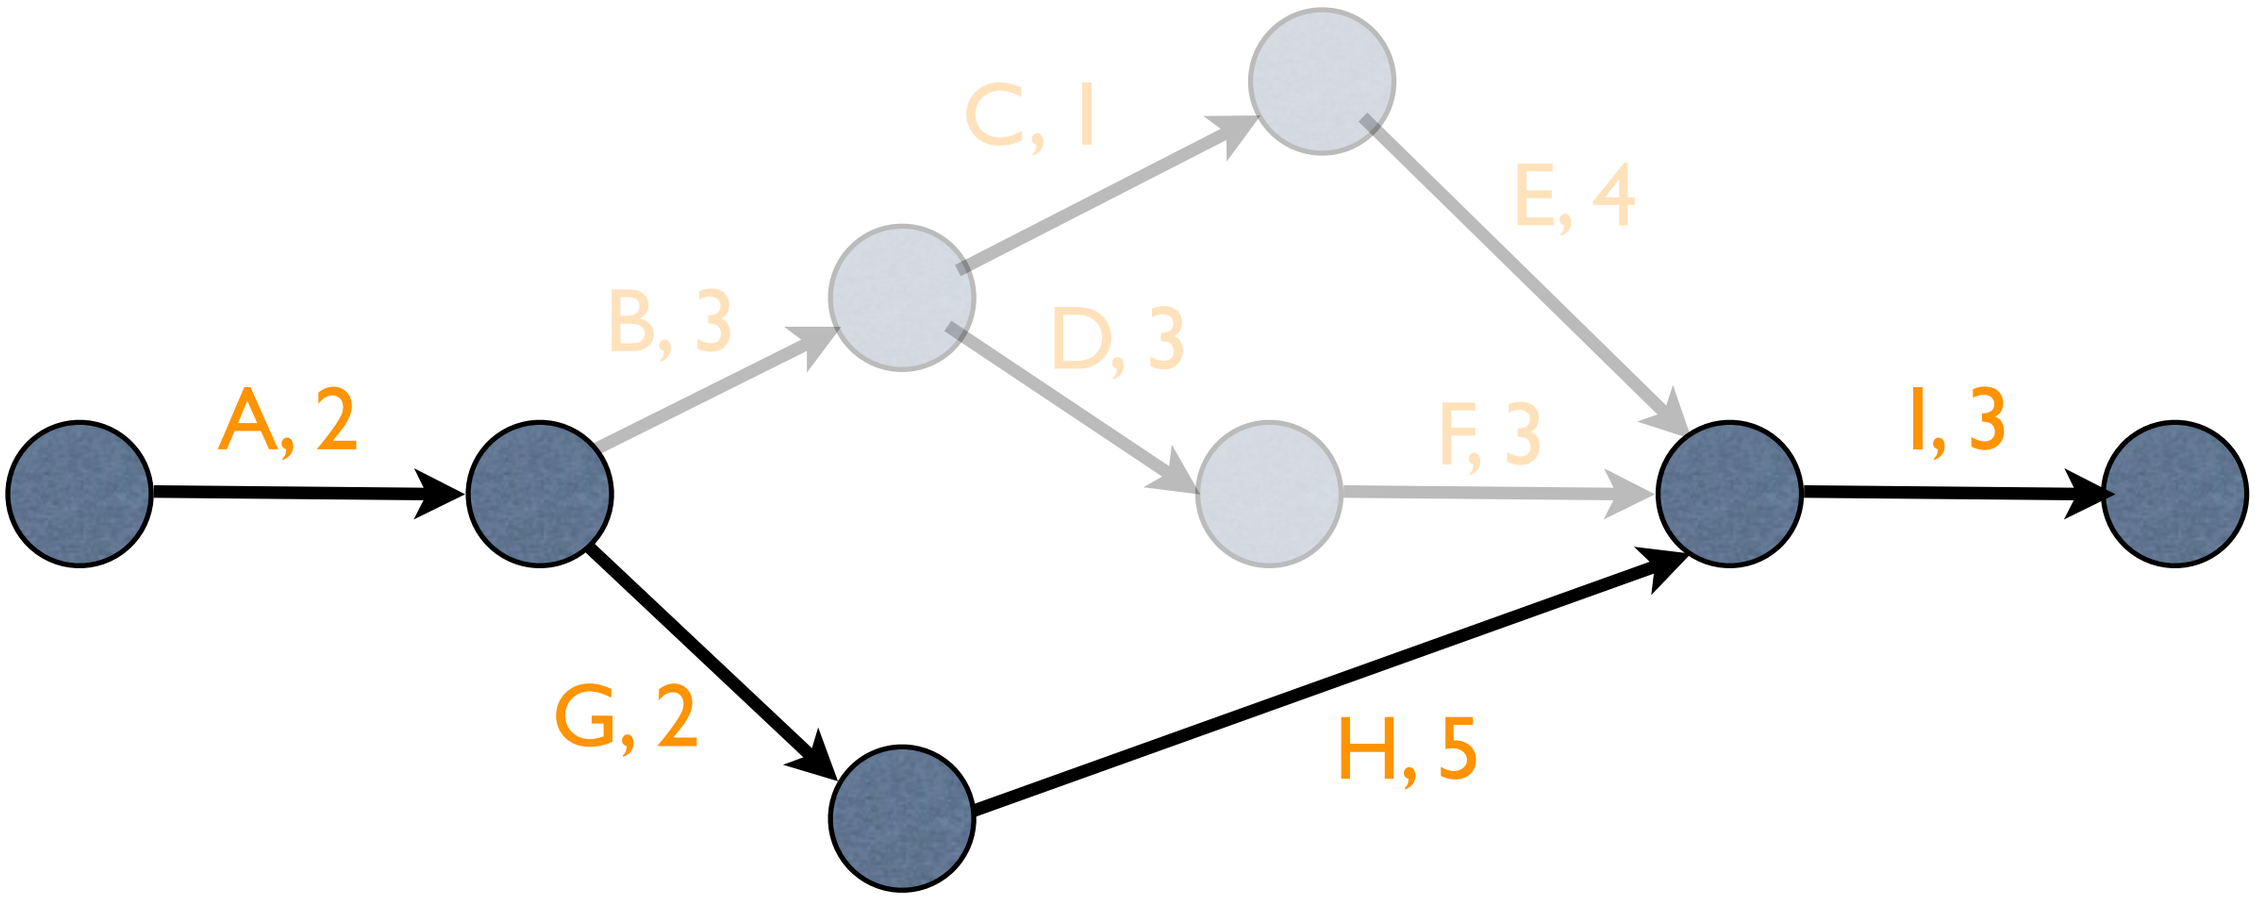
Nodes indicate the start and end points of tasks.



PERT Charts

There are several routes to reach from start to finish.

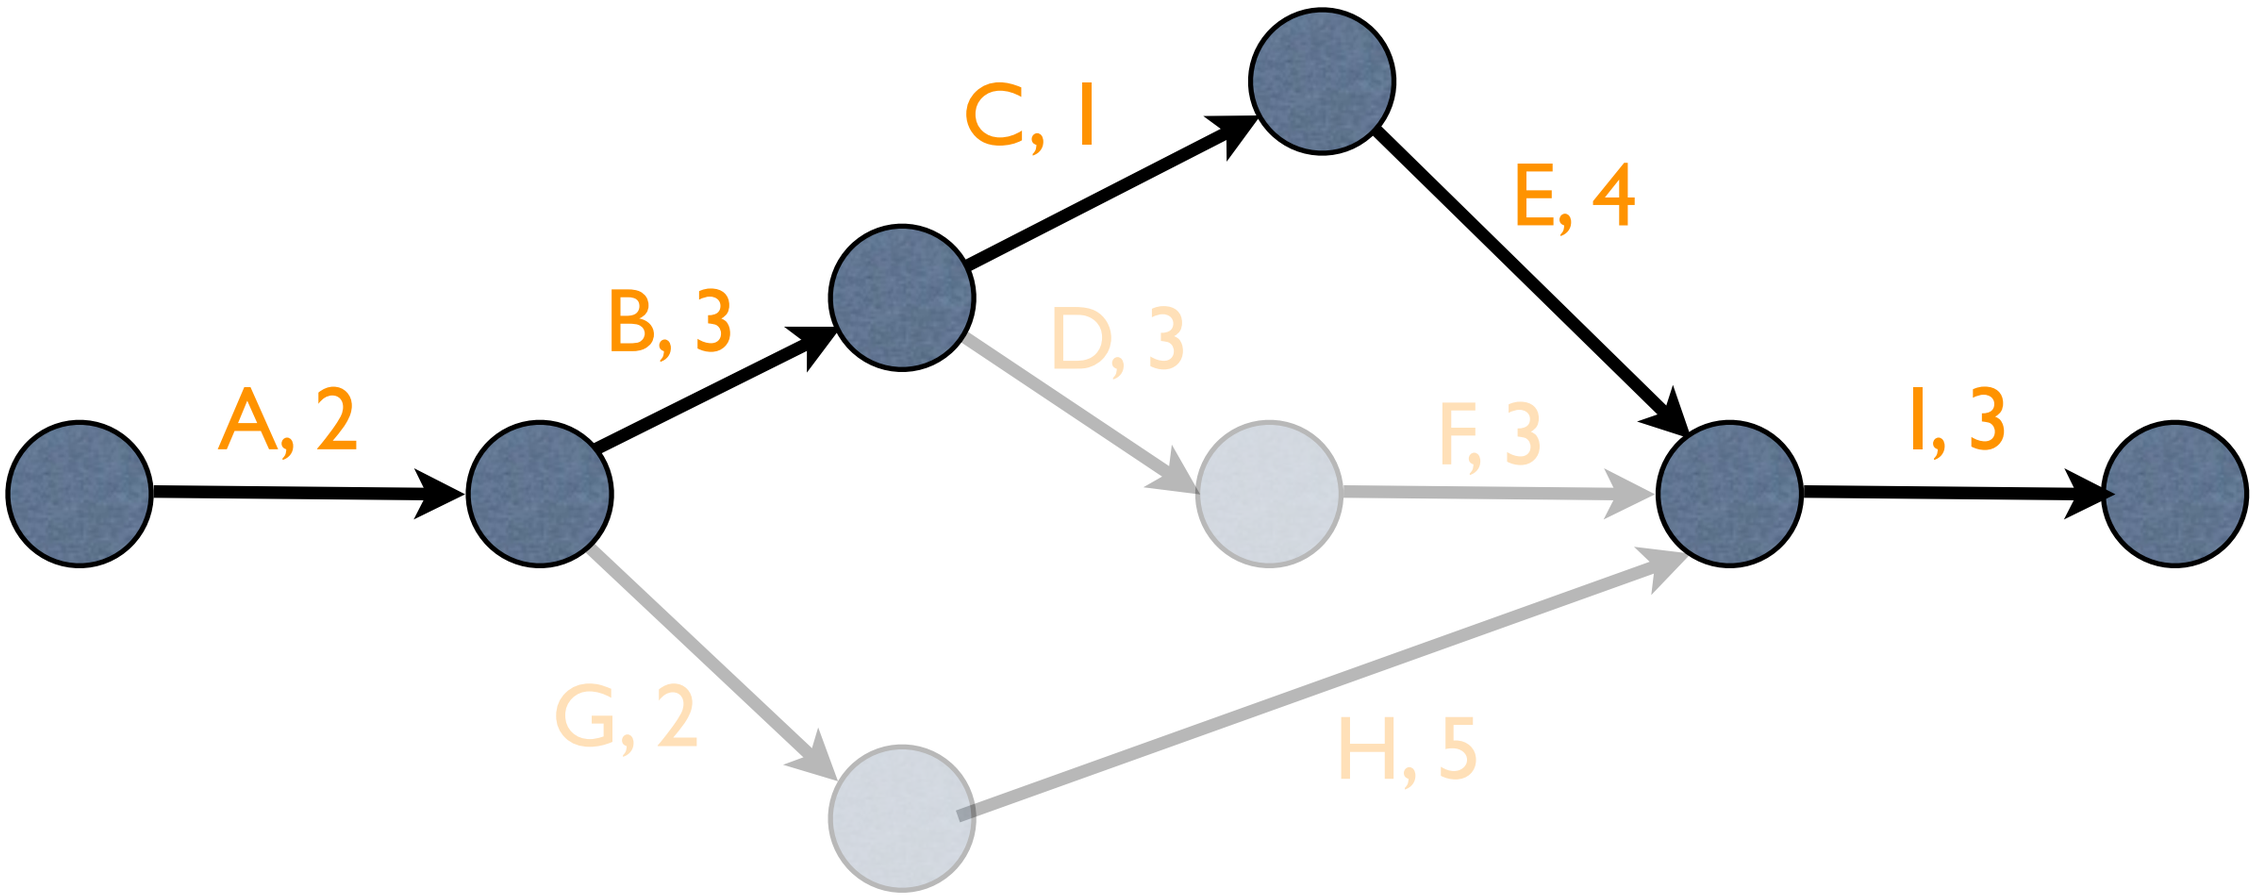
Time to complete: 12 days!



PERT Charts

There are several routes to reach from start to finish.

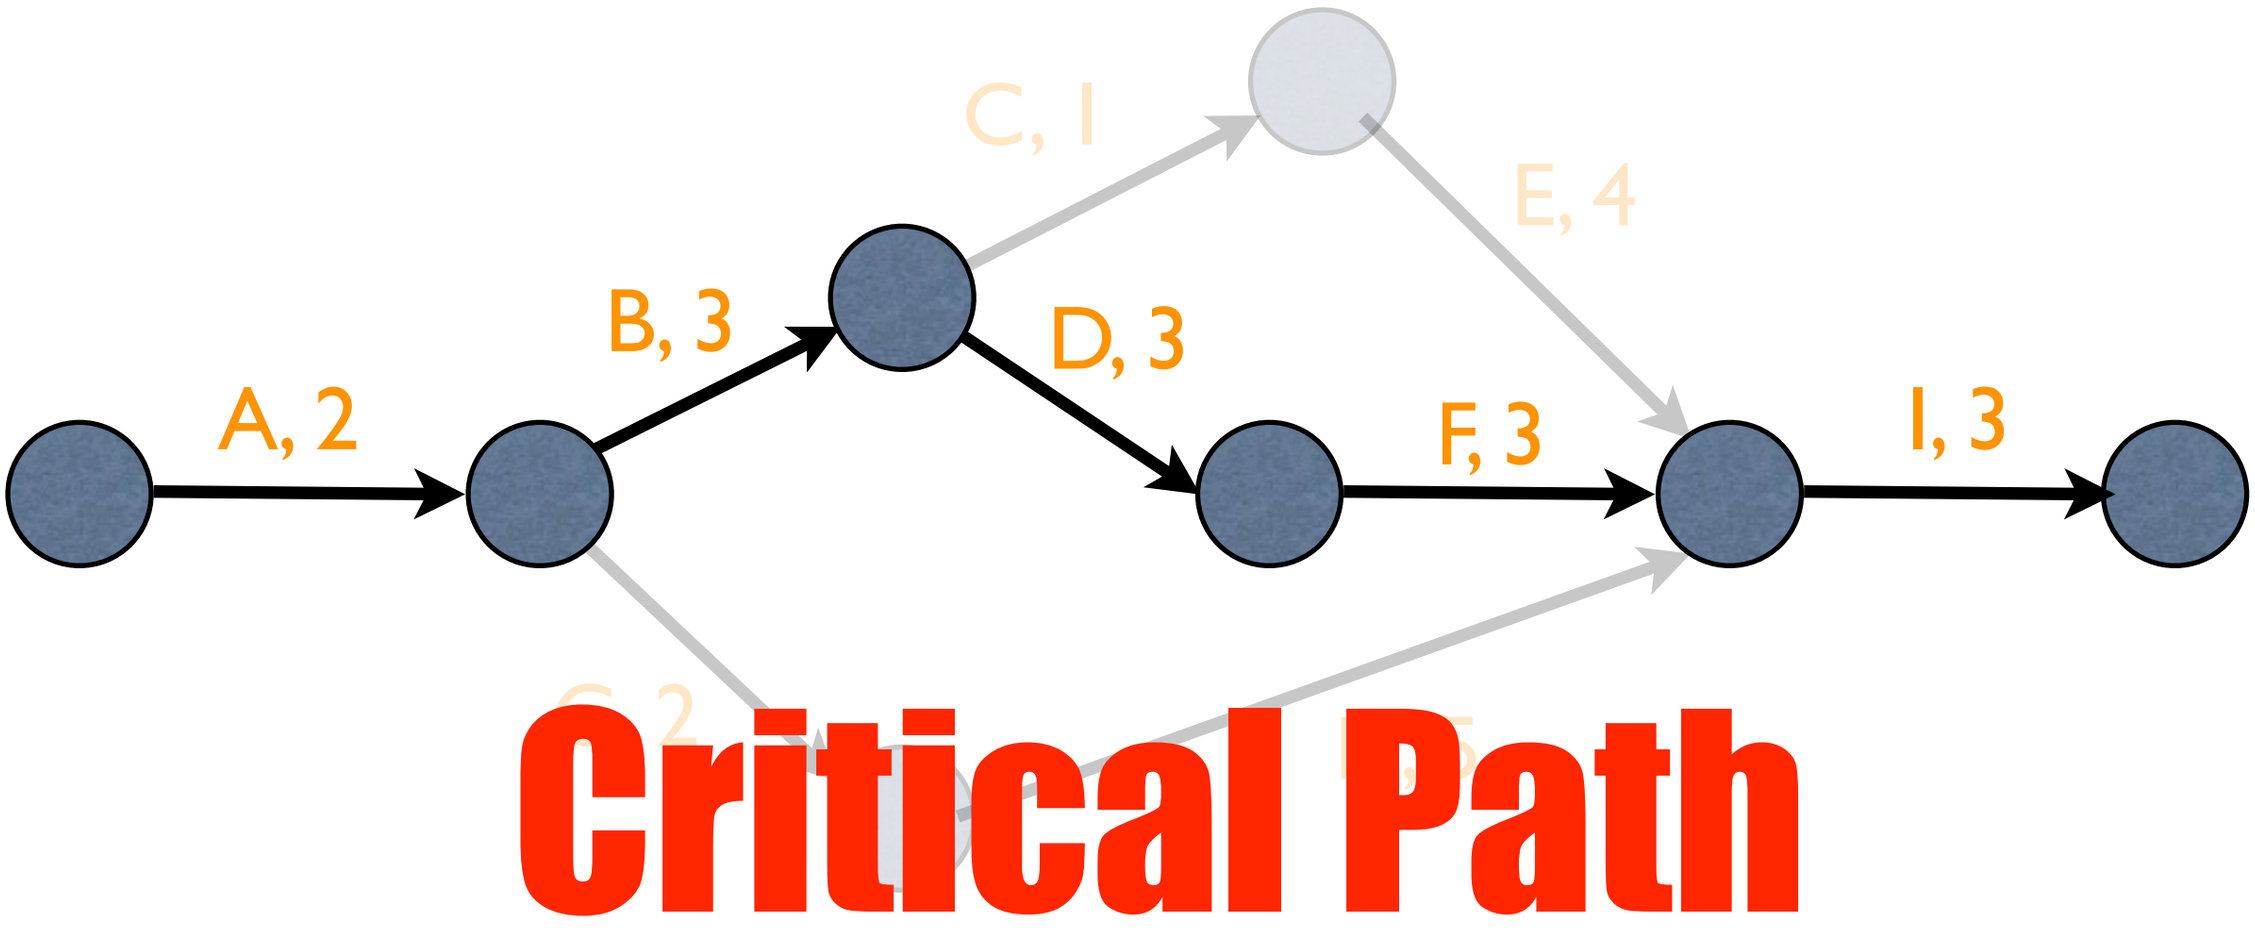
Time to complete: 13 days!



PERT Charts

There are several routes to reach from start to finish.

Time to complete: 14 days!



PERT Charts

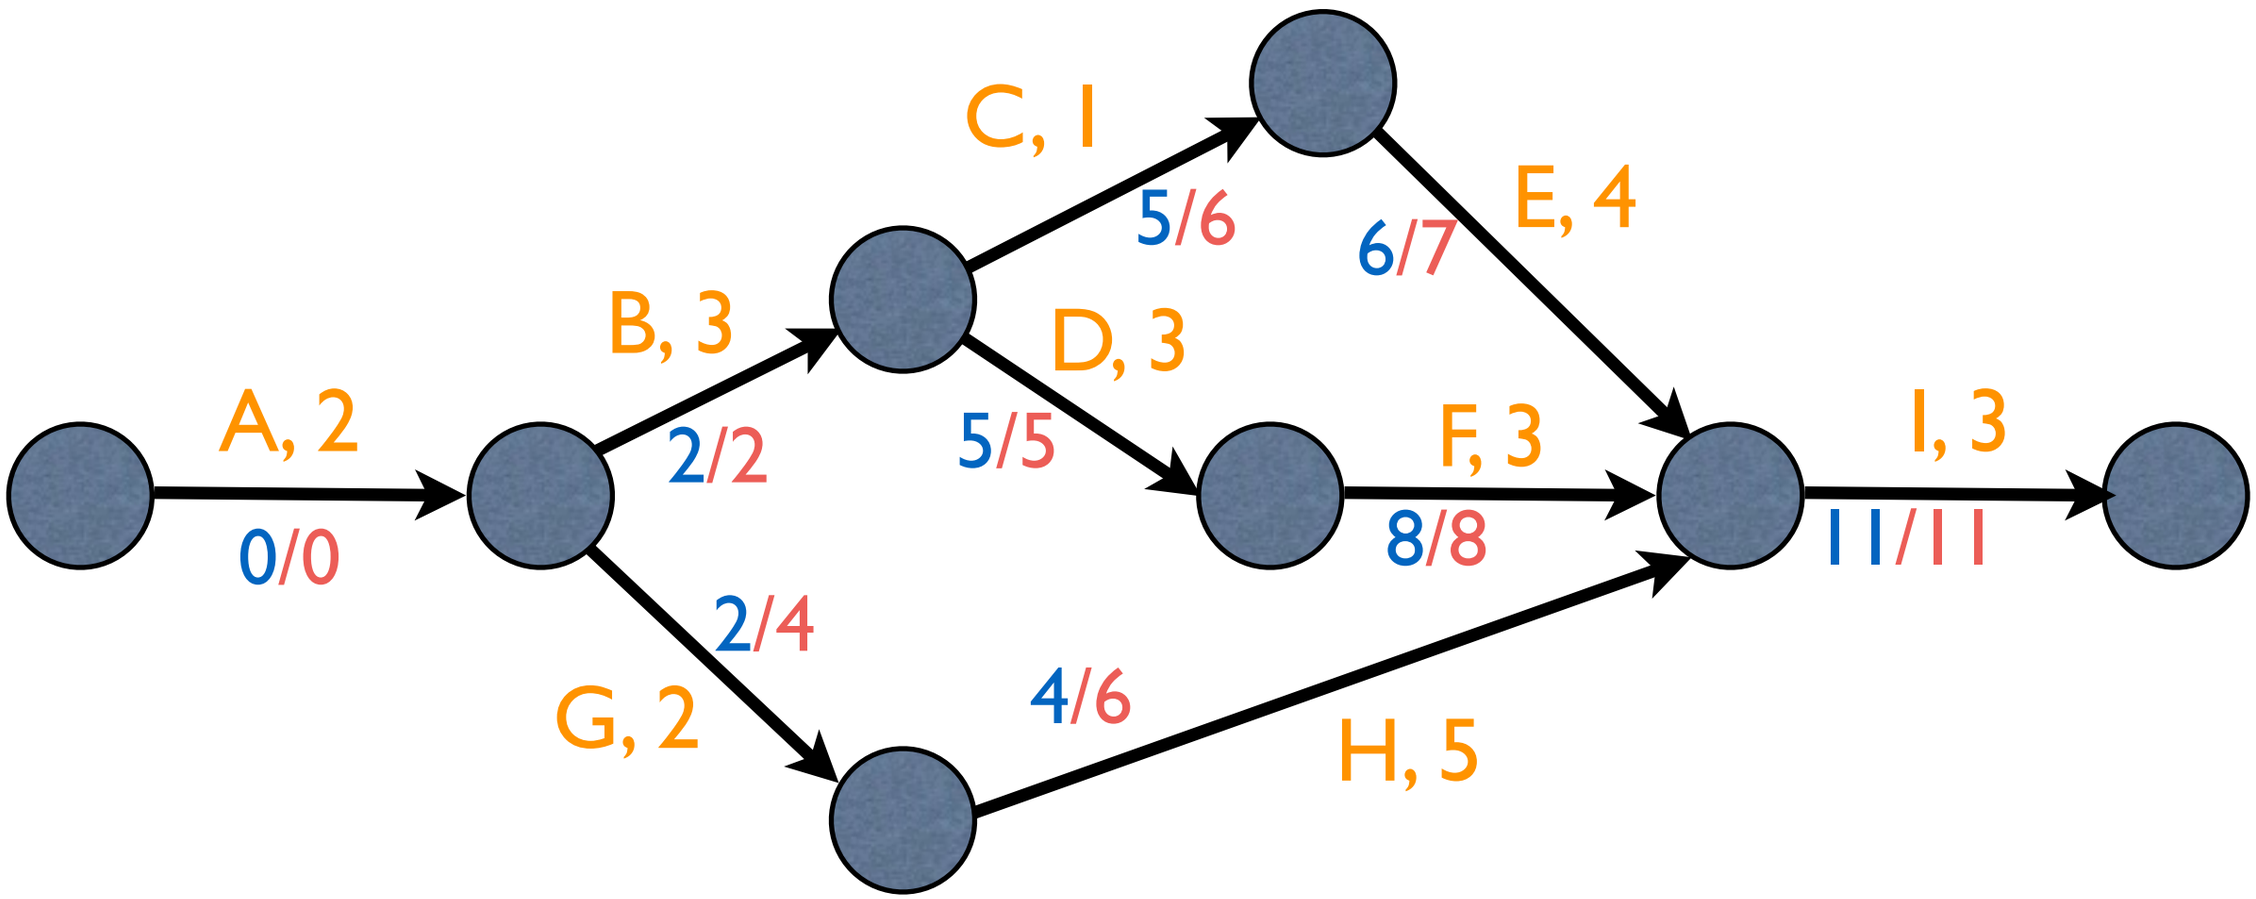
- Any delay to an activity in the critical path will cause delays to the overall project.

- Delays to activities not on the critical path may relax :-), but keep a watch on *slack*

PERT Charts

- Optimistic time (O): the minimum possible time required to accomplish a task

PERT Chart

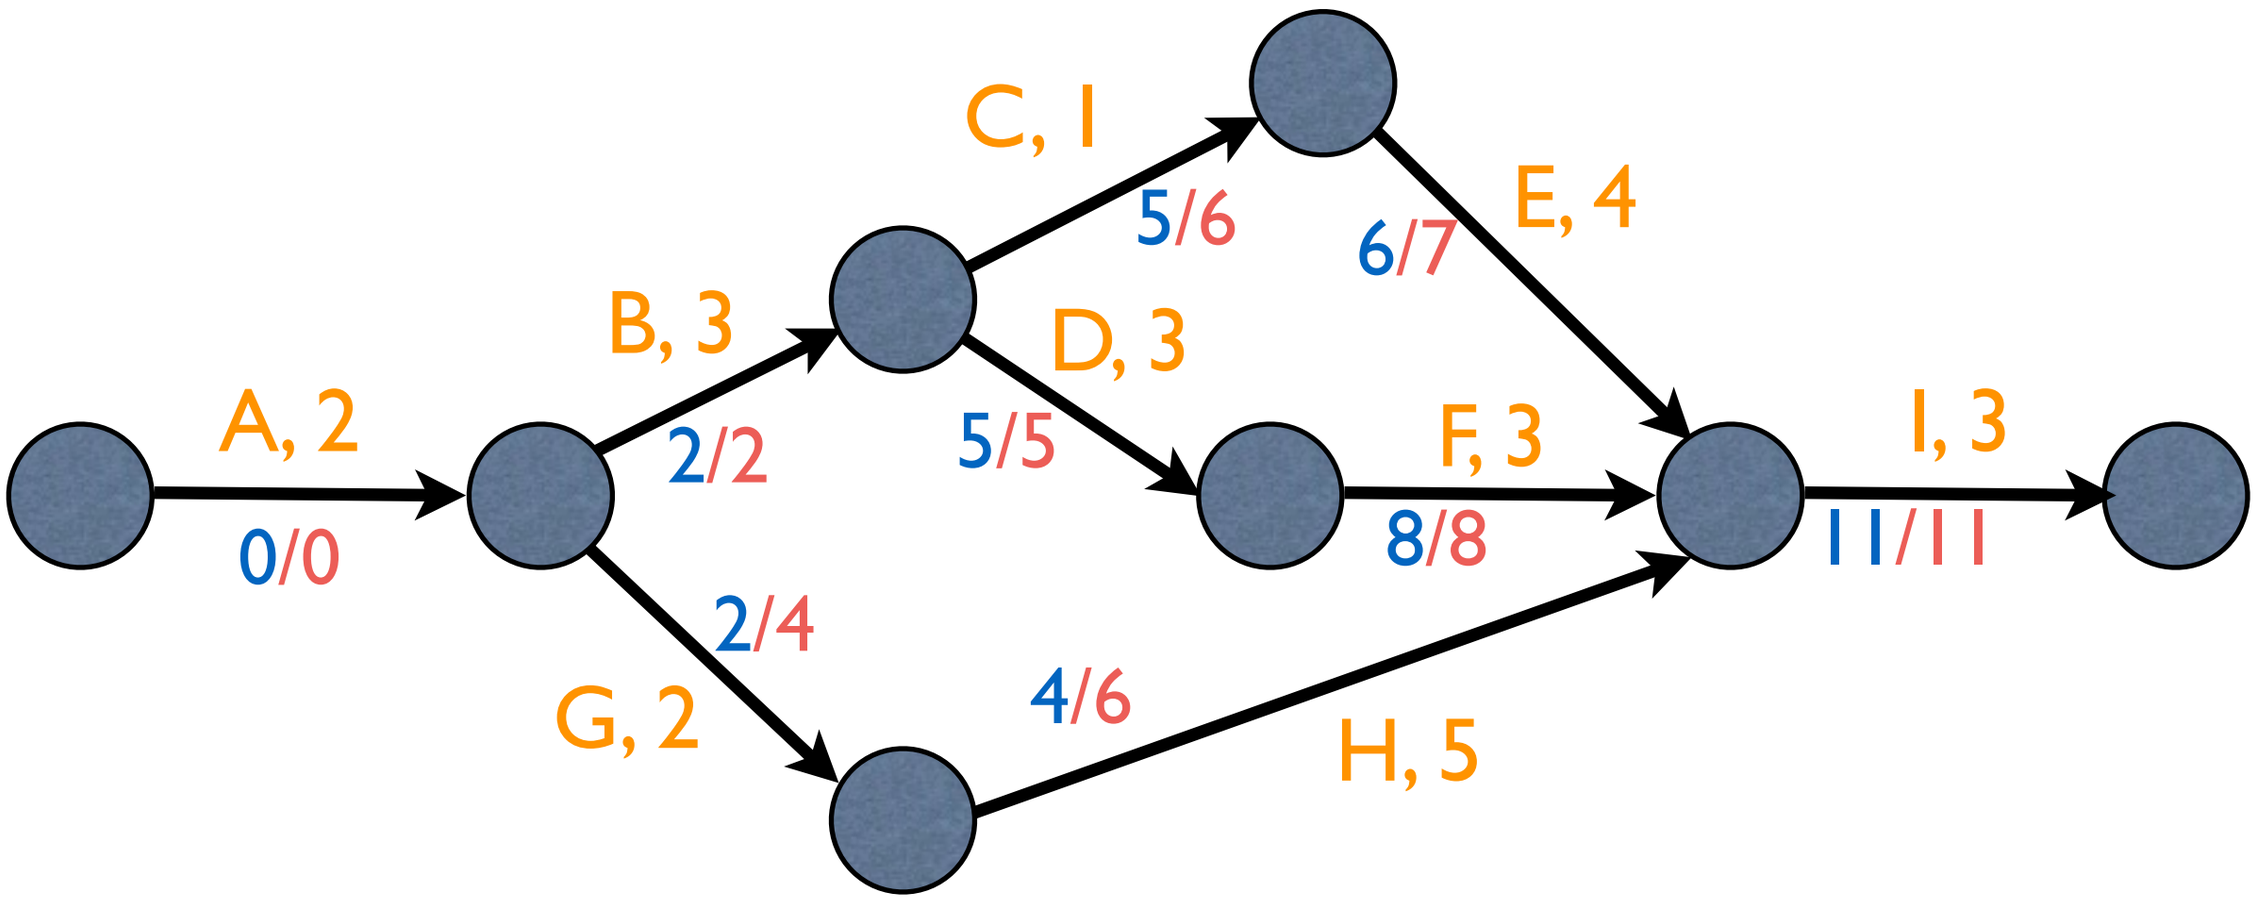


What is the optimistic time (O) ?

PERT Charts

- Pessimistic time (P): the maximum possible time required to accomplish a task

PERT Chart

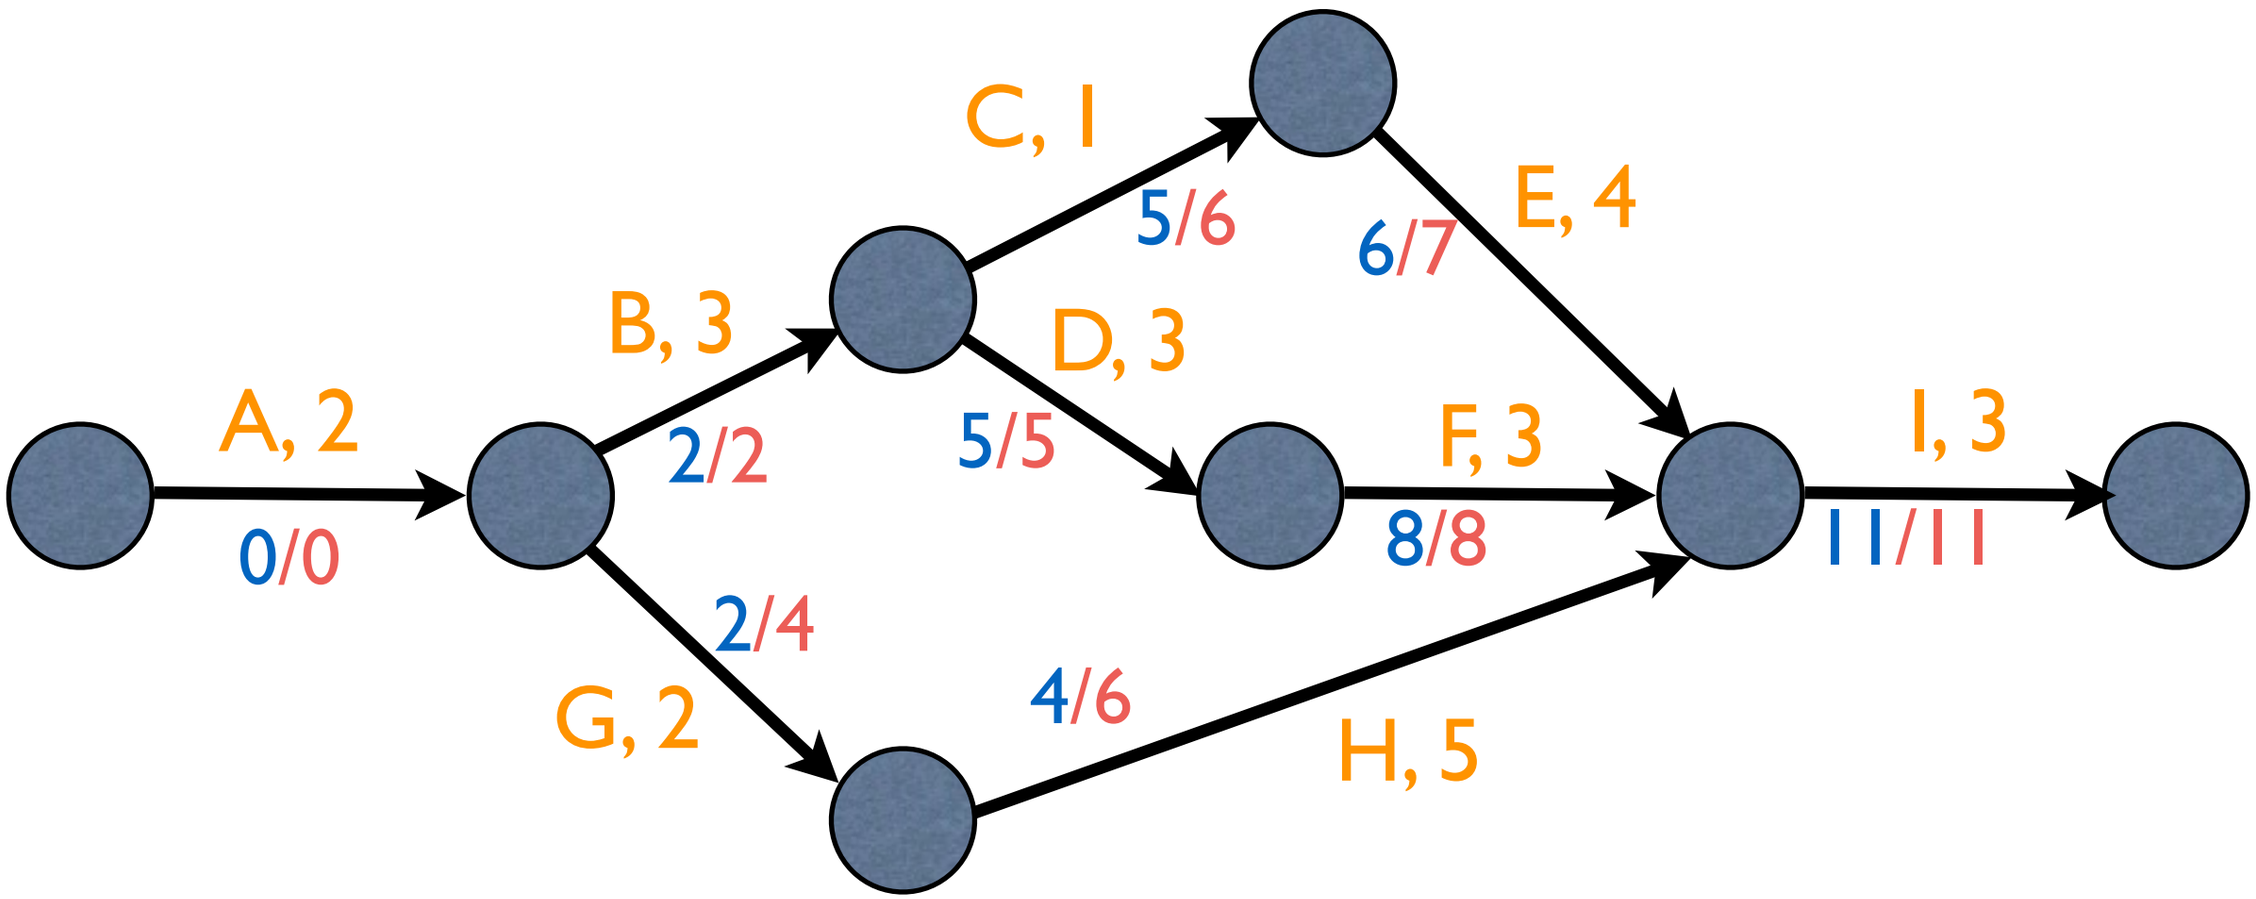


What is the pessimistic time (P) ?

PERT Charts

- Most likely time (M): the best estimate of the time required to accomplish a task

PERT Chart

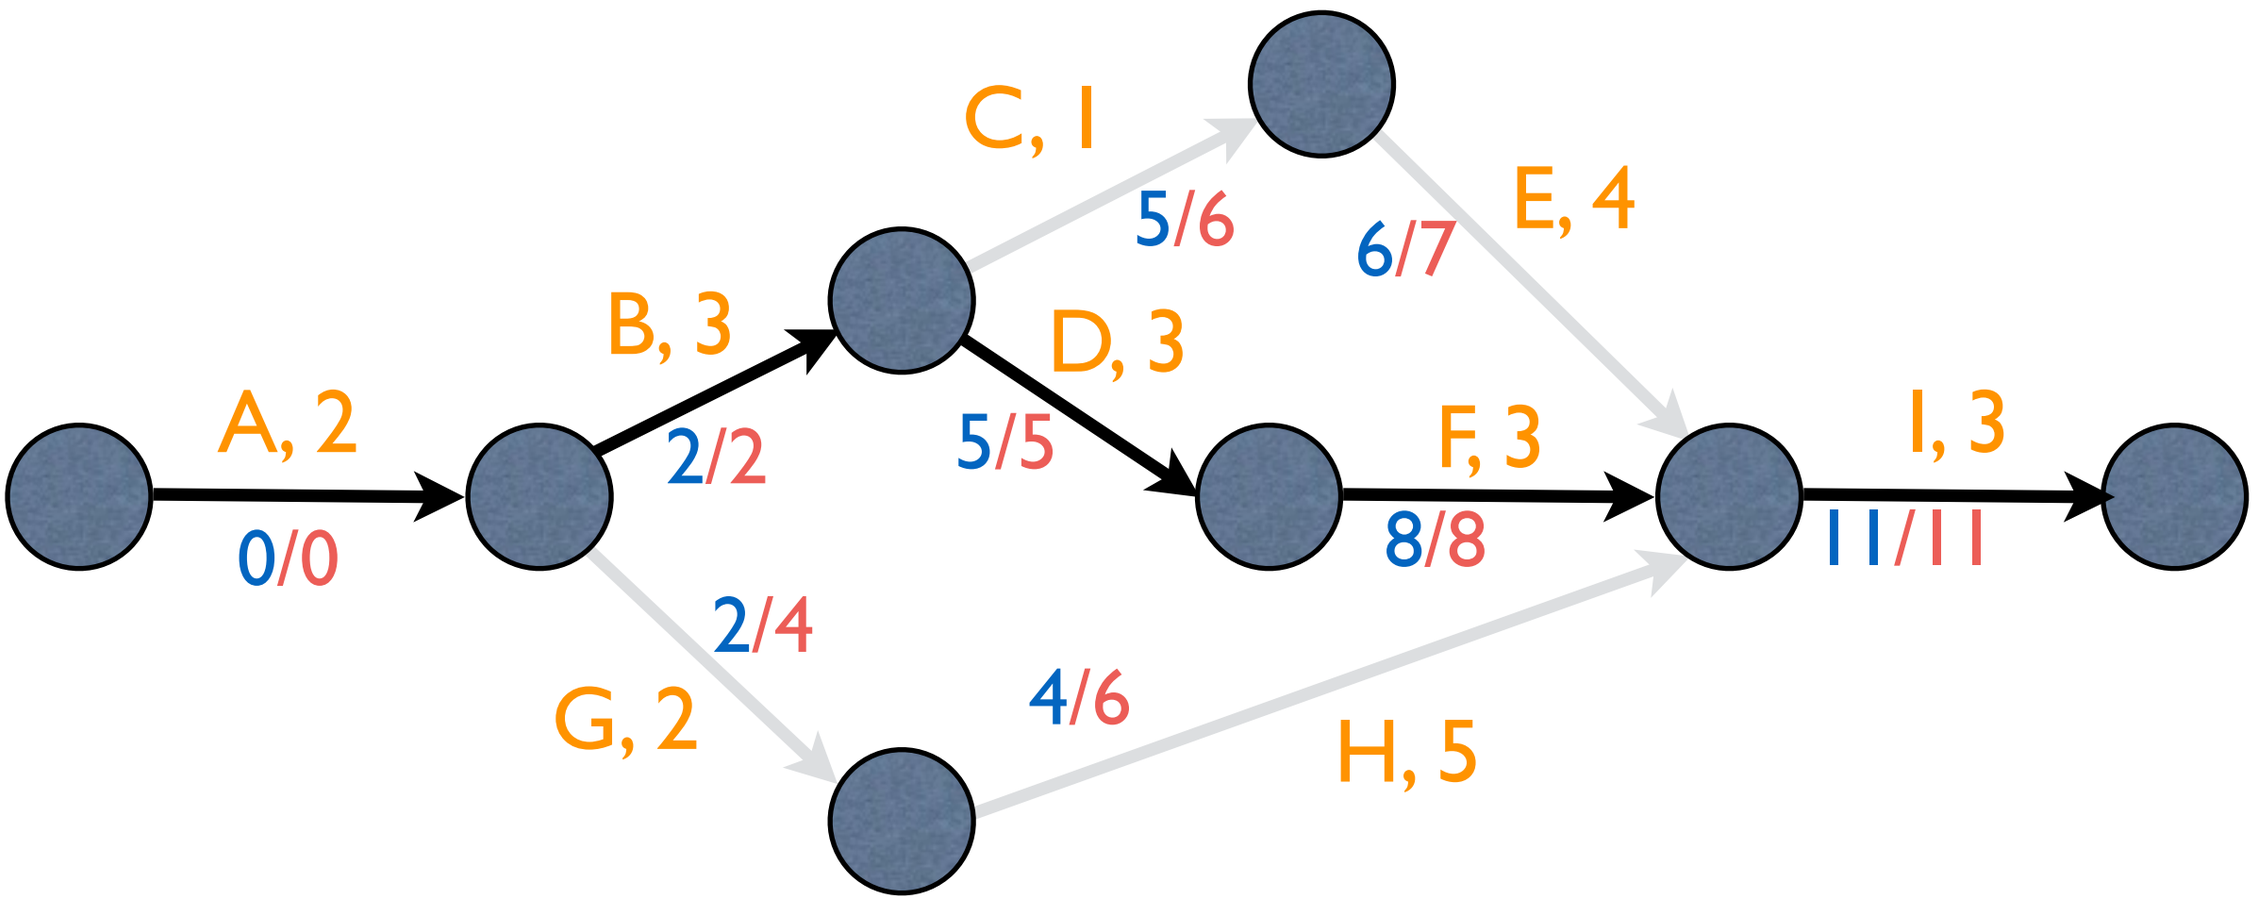


What is the most likely time (M) ?

PERT Charts

Critical path

- Why is it called *critical?*



PERT Charts

Critical path

- Why is it called *critical?*
- *How should we optimise critical path?*

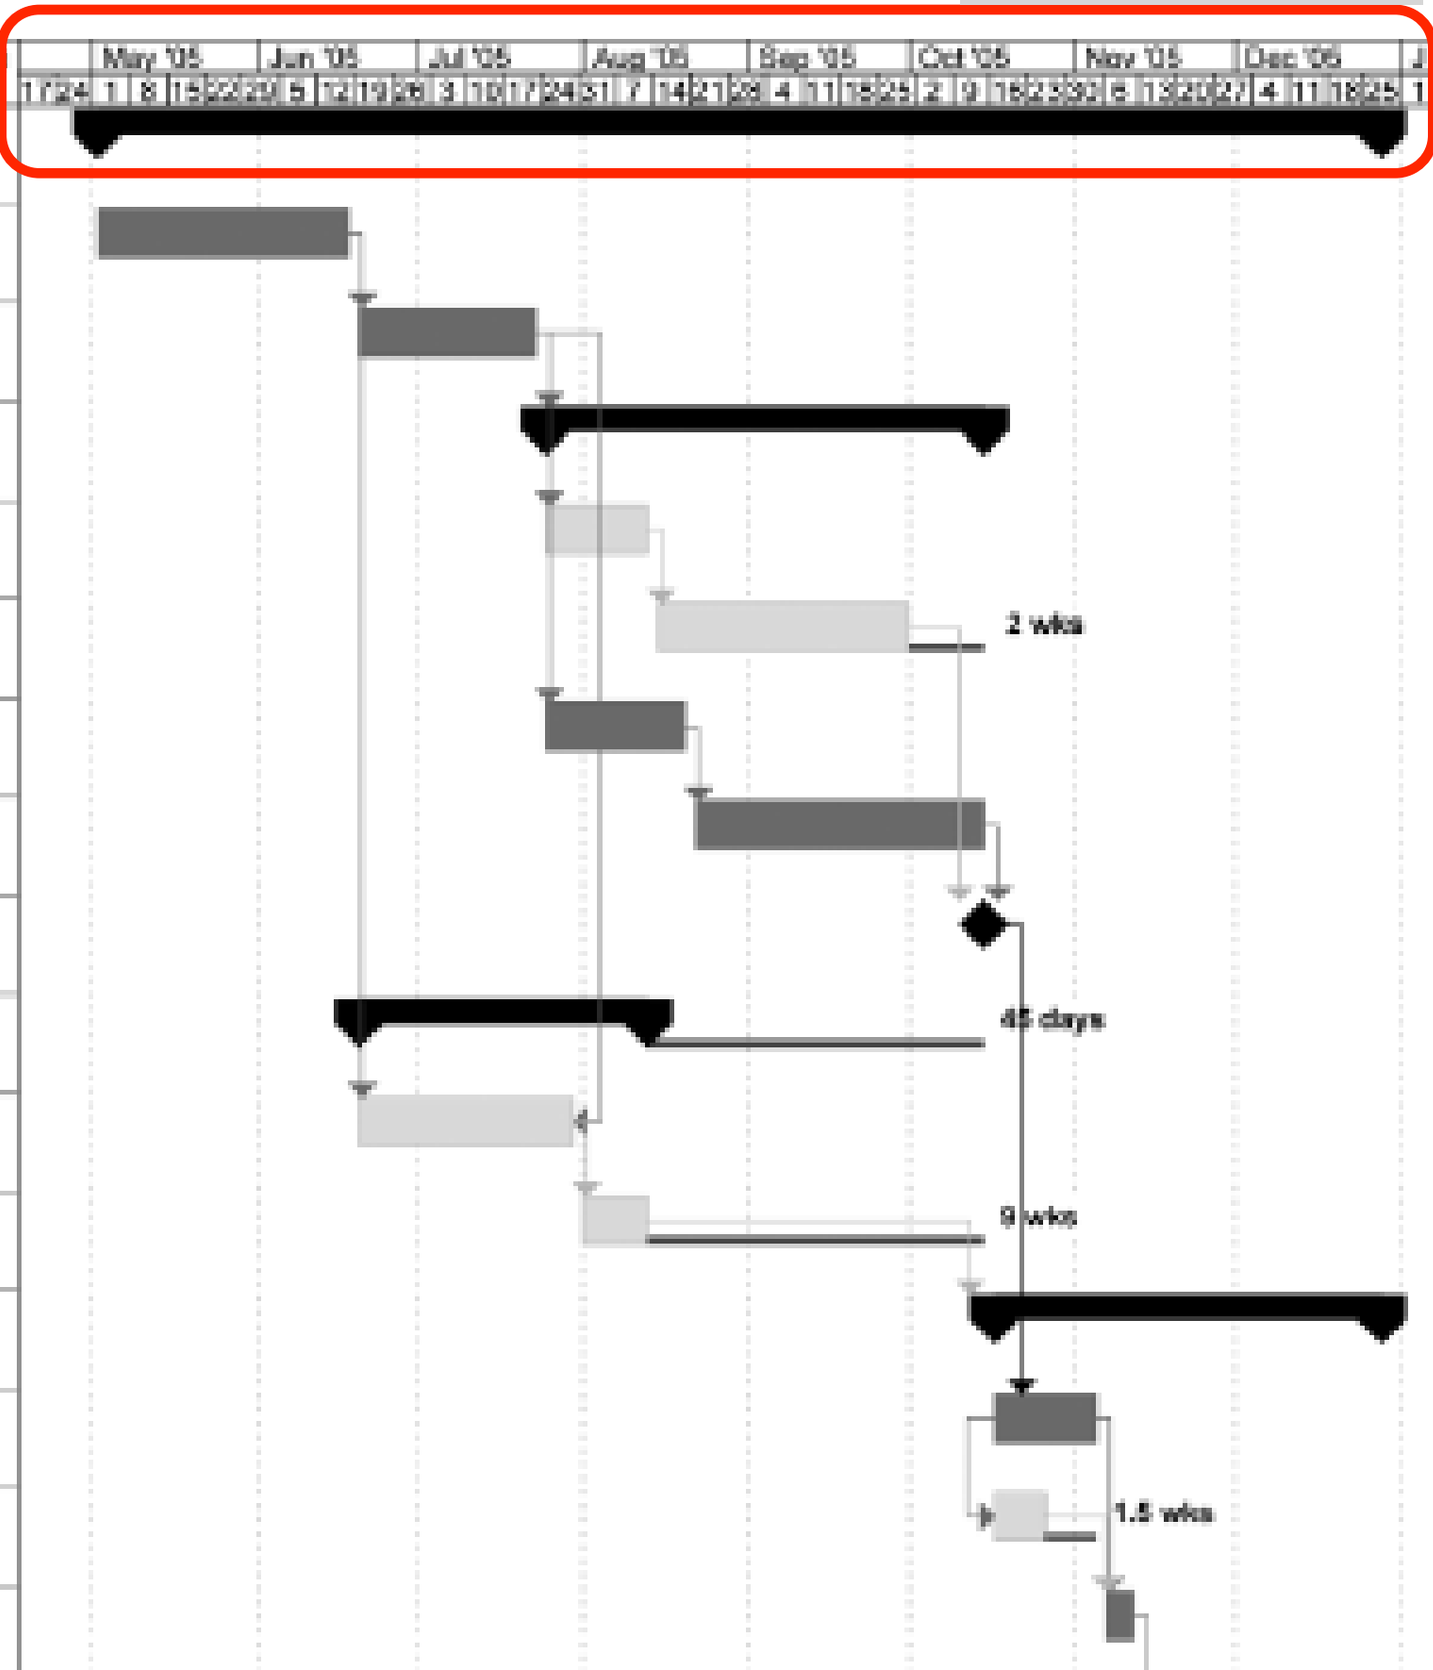
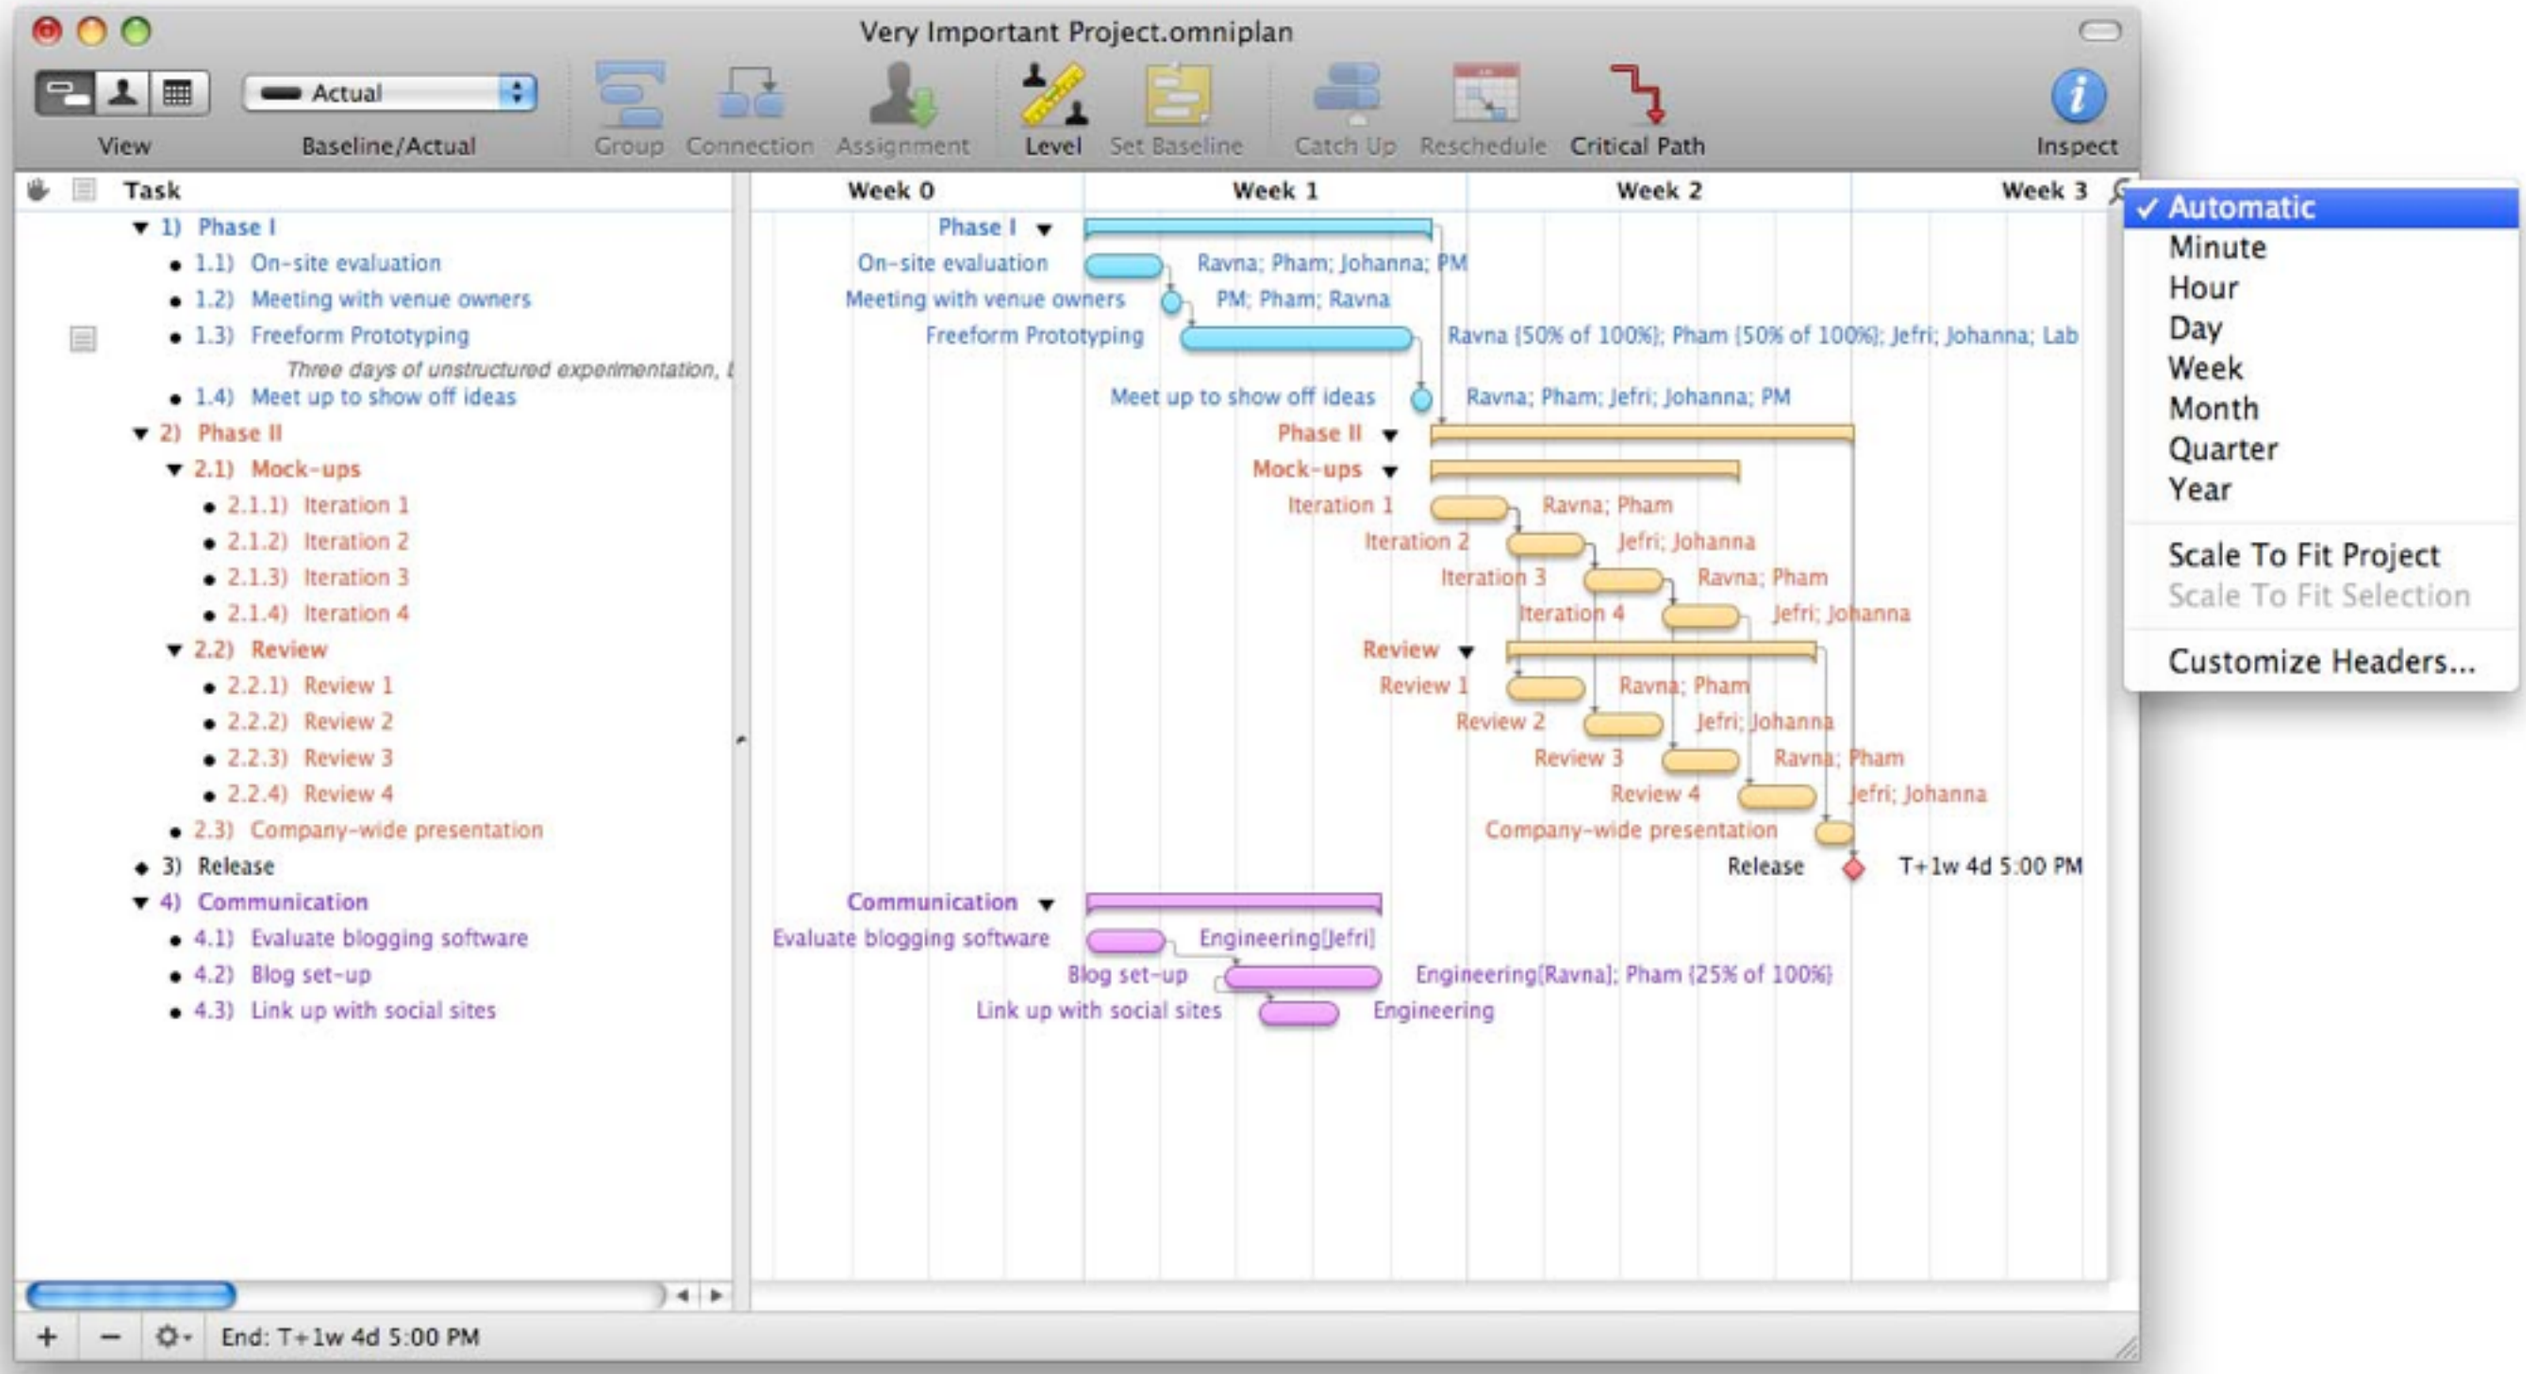
Duration

ID		Duration	Predece
1	**Software Project**	**172.5 days**	
2	Requirements	7 wks	
3	Design	5 wks	2
4	**Programming**	**60 days**	3
5	Unit Tests for Feature A	3 wks	3
6	Program Feature A	7 wks	5
7	Unit Tests for Feature B	4 wks	3
8	Program Feature B	8 wks	7
9	Feature-Complete Build	0 days	6,8
10	**Test Preparation**	**40 days**	
11	Build Test Plans	6 wks	2,3FF
12	Review, Correct Test Plans	2 wks	11
13	**Test Execution**	**52.5 days**	12
14	Execute Test Plan A	3 wks	9
15	Execute Test Plan B	1.5 wks	14SS
16	Fix Defects	1 wk	14,15

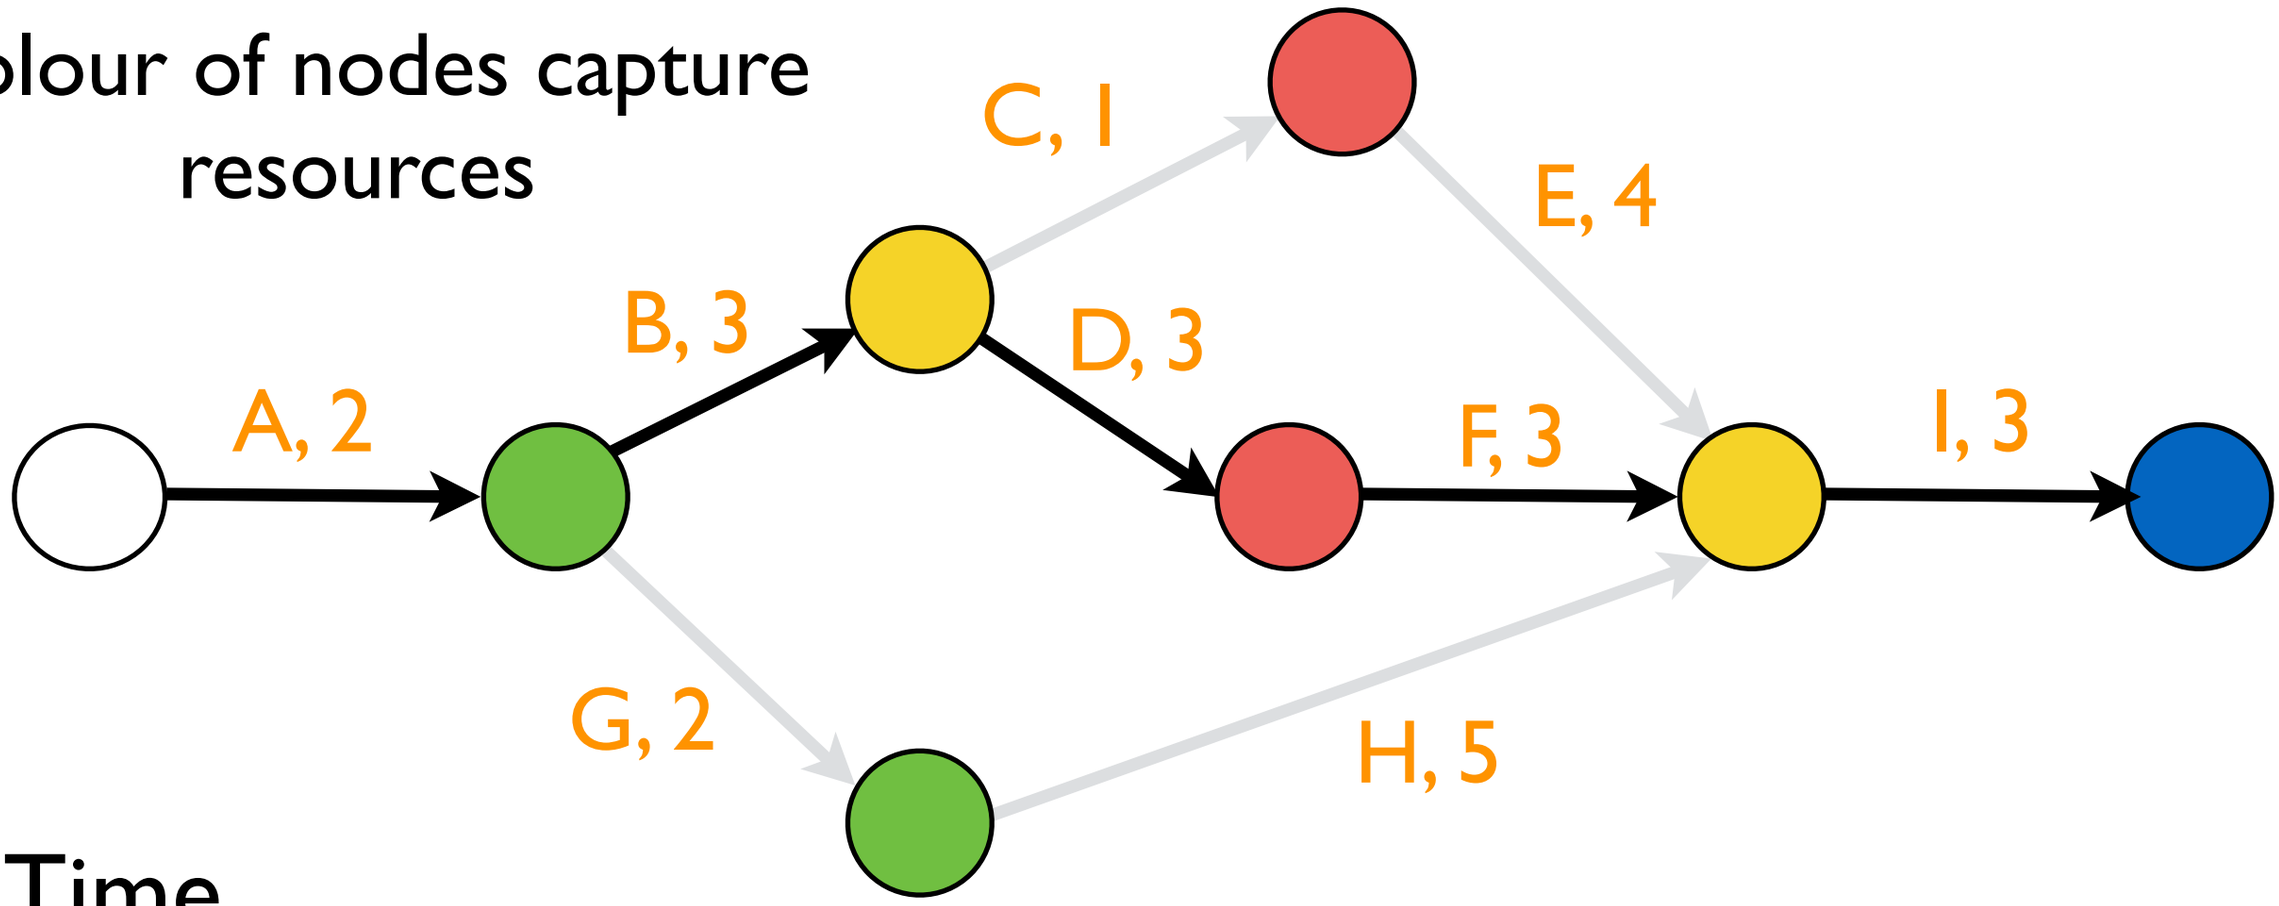


Project Planning Tools

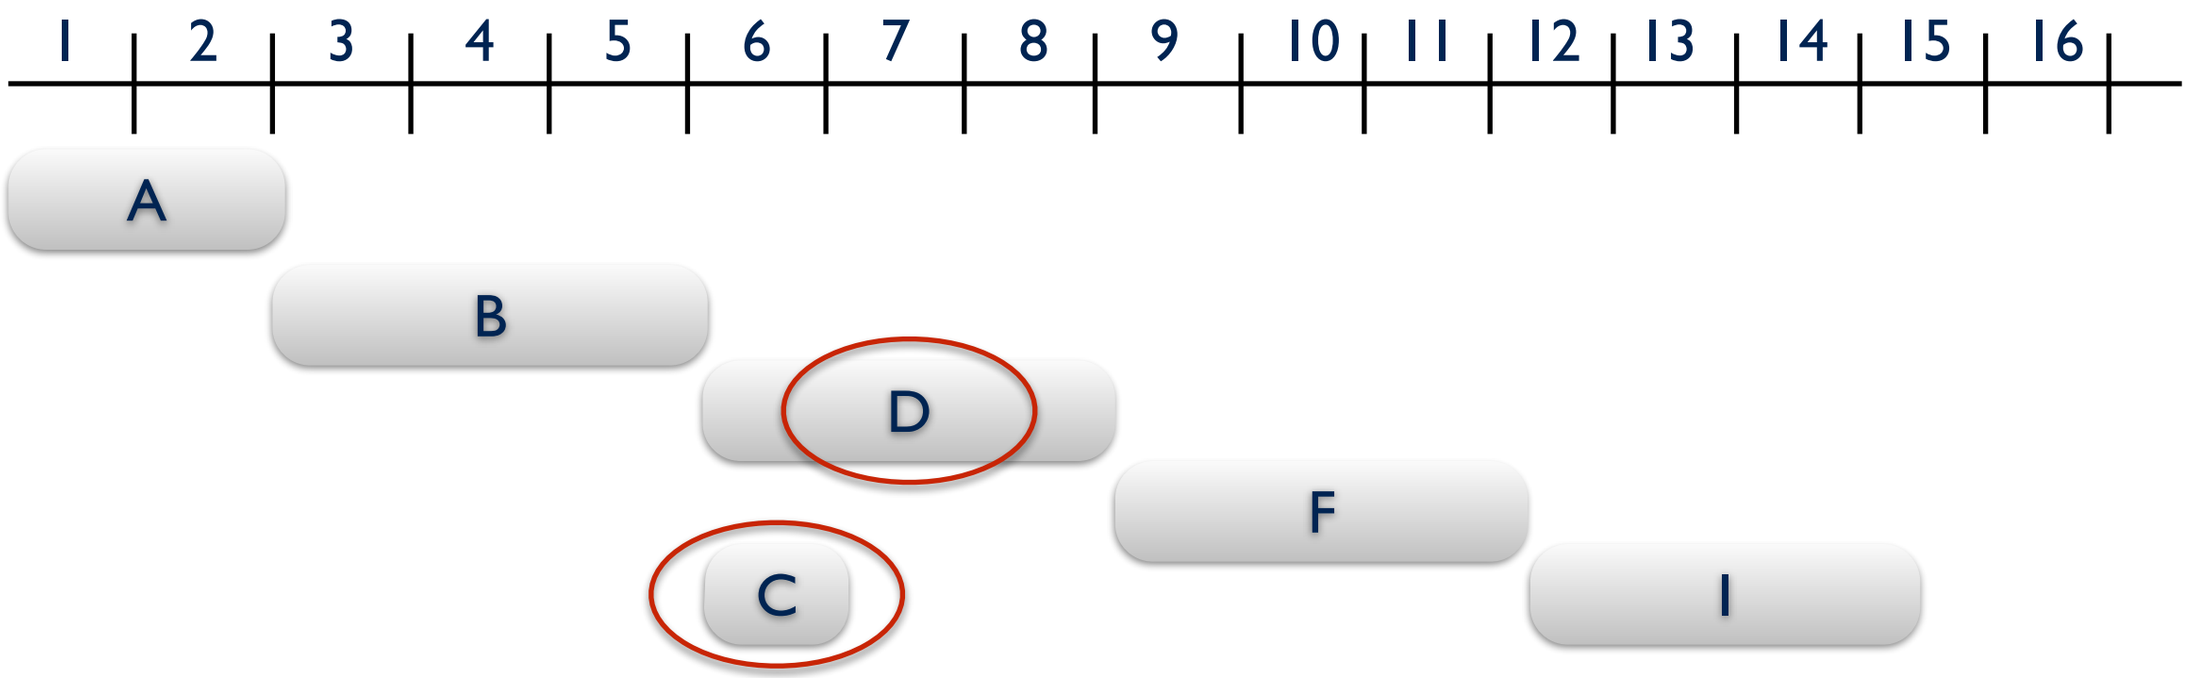


Wait!!!

Colour of nodes capture resources



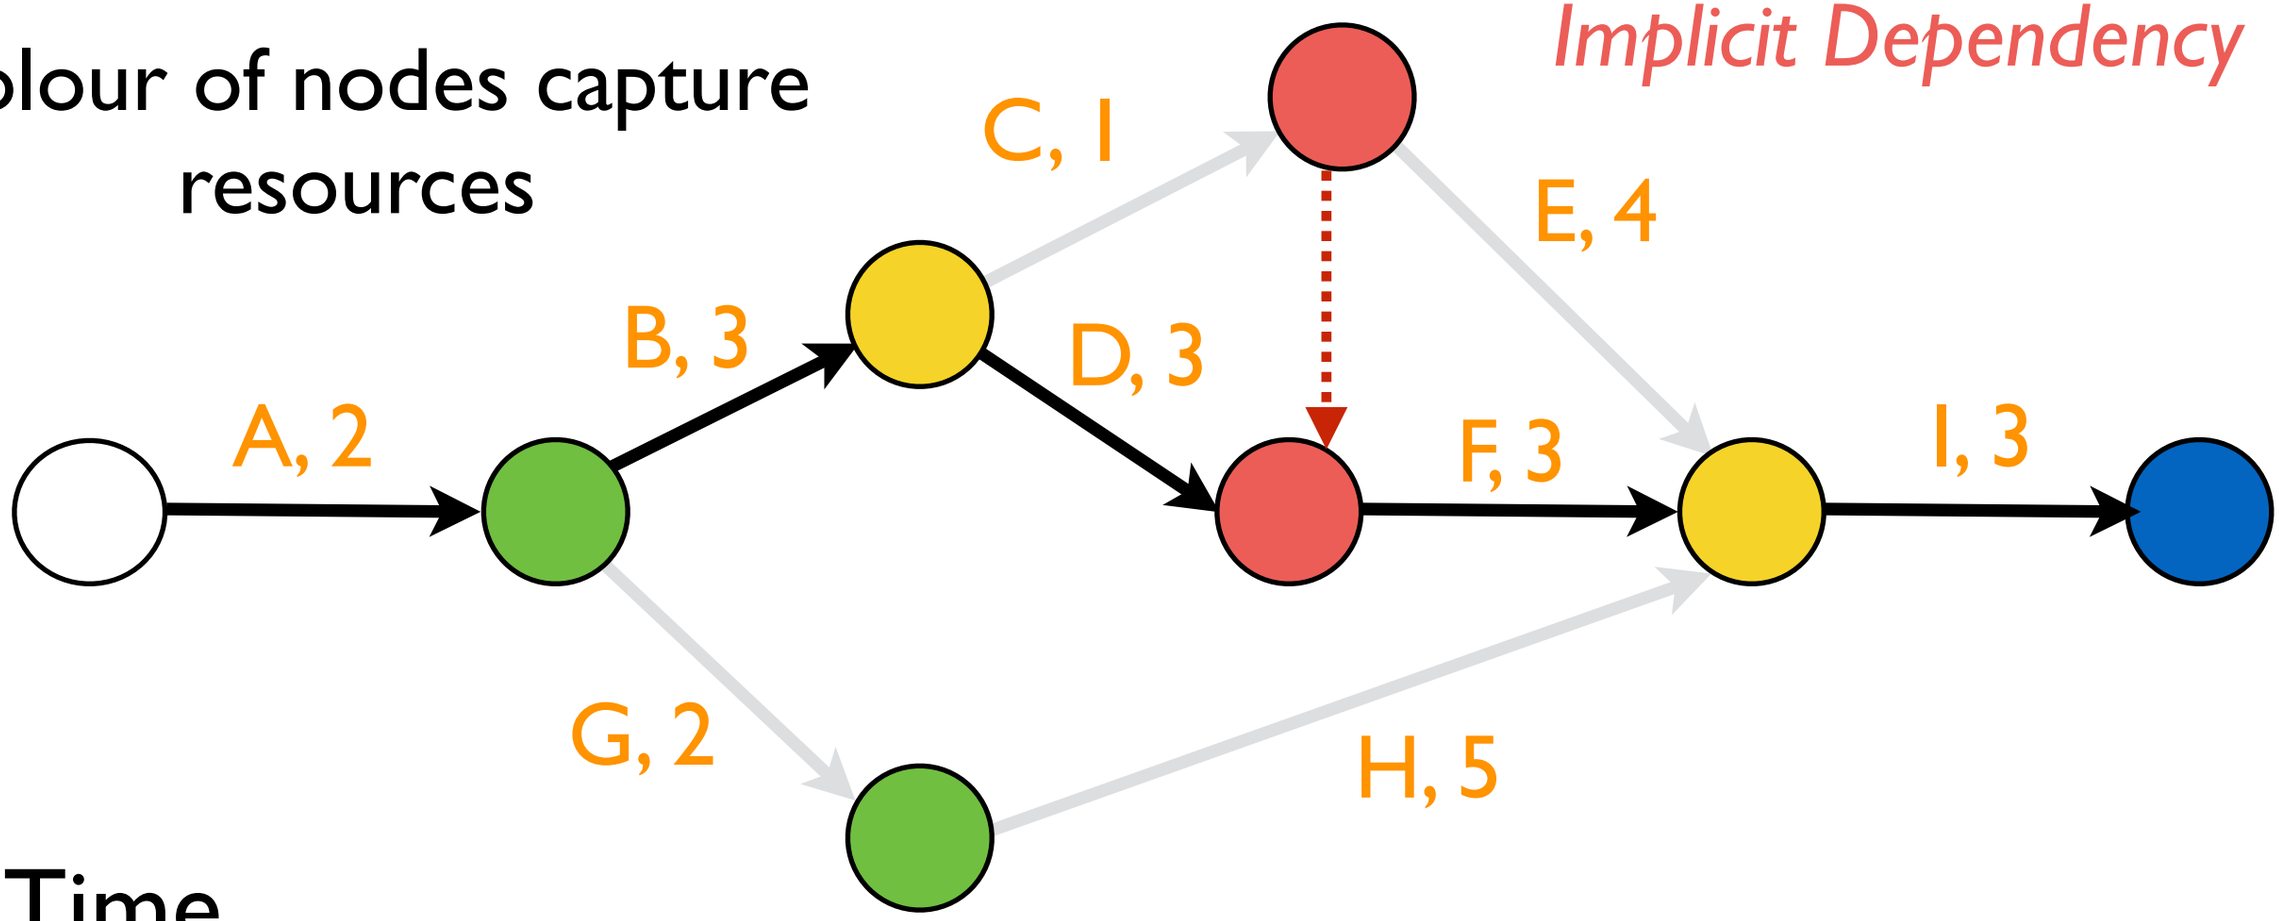
Time



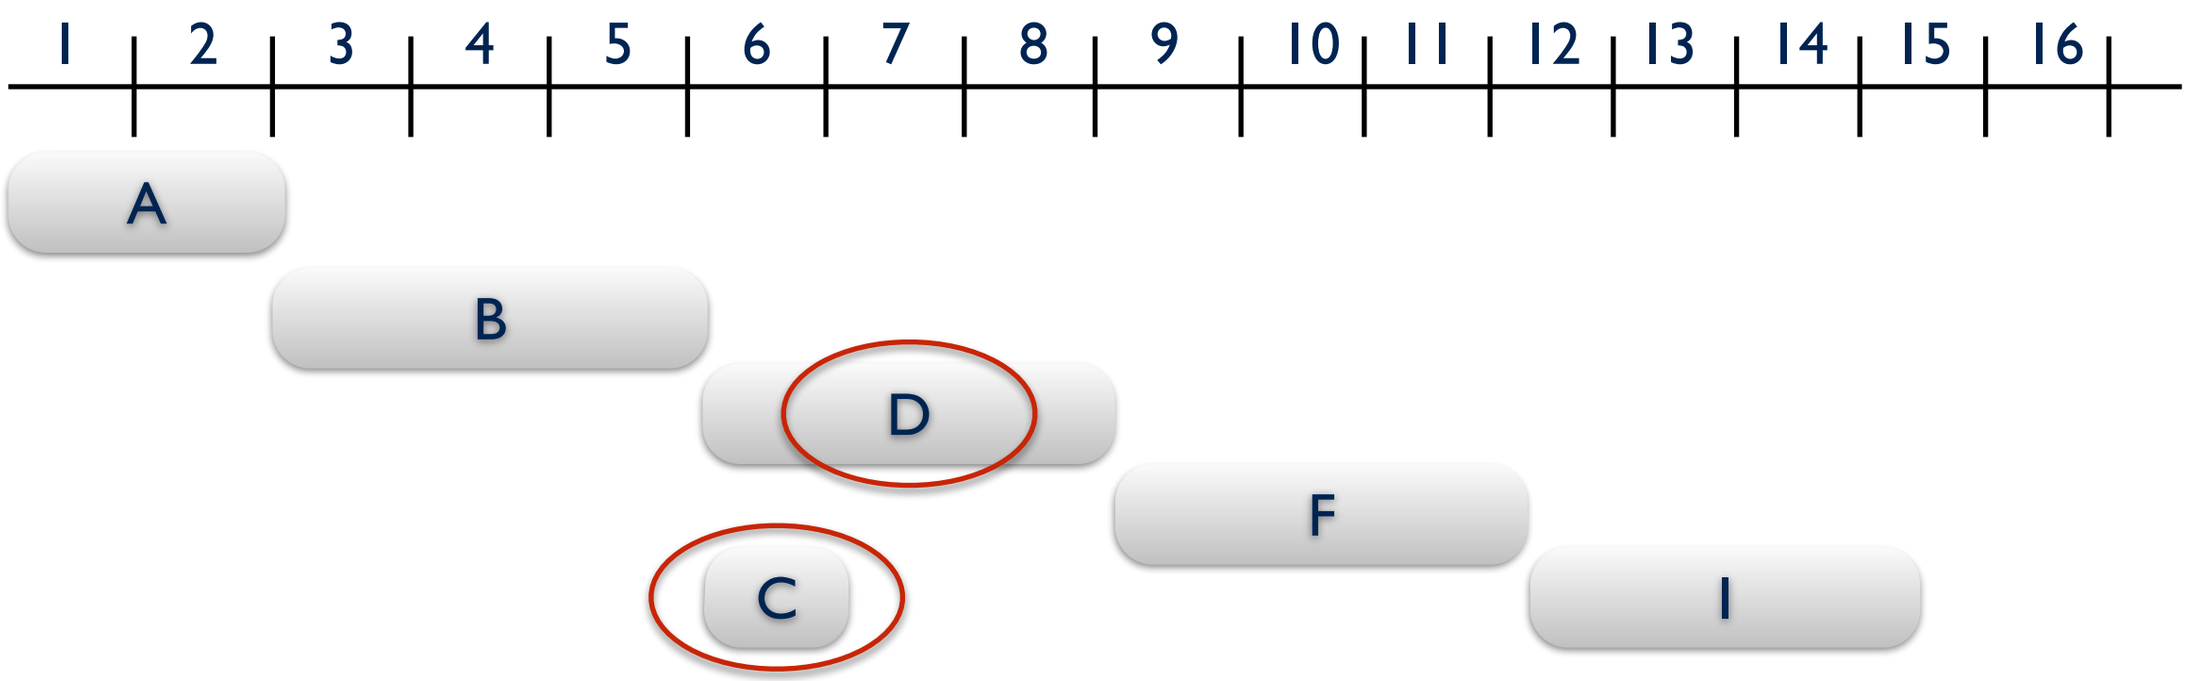
Wait!!!

Colour of nodes capture resources

Implicit Dependency



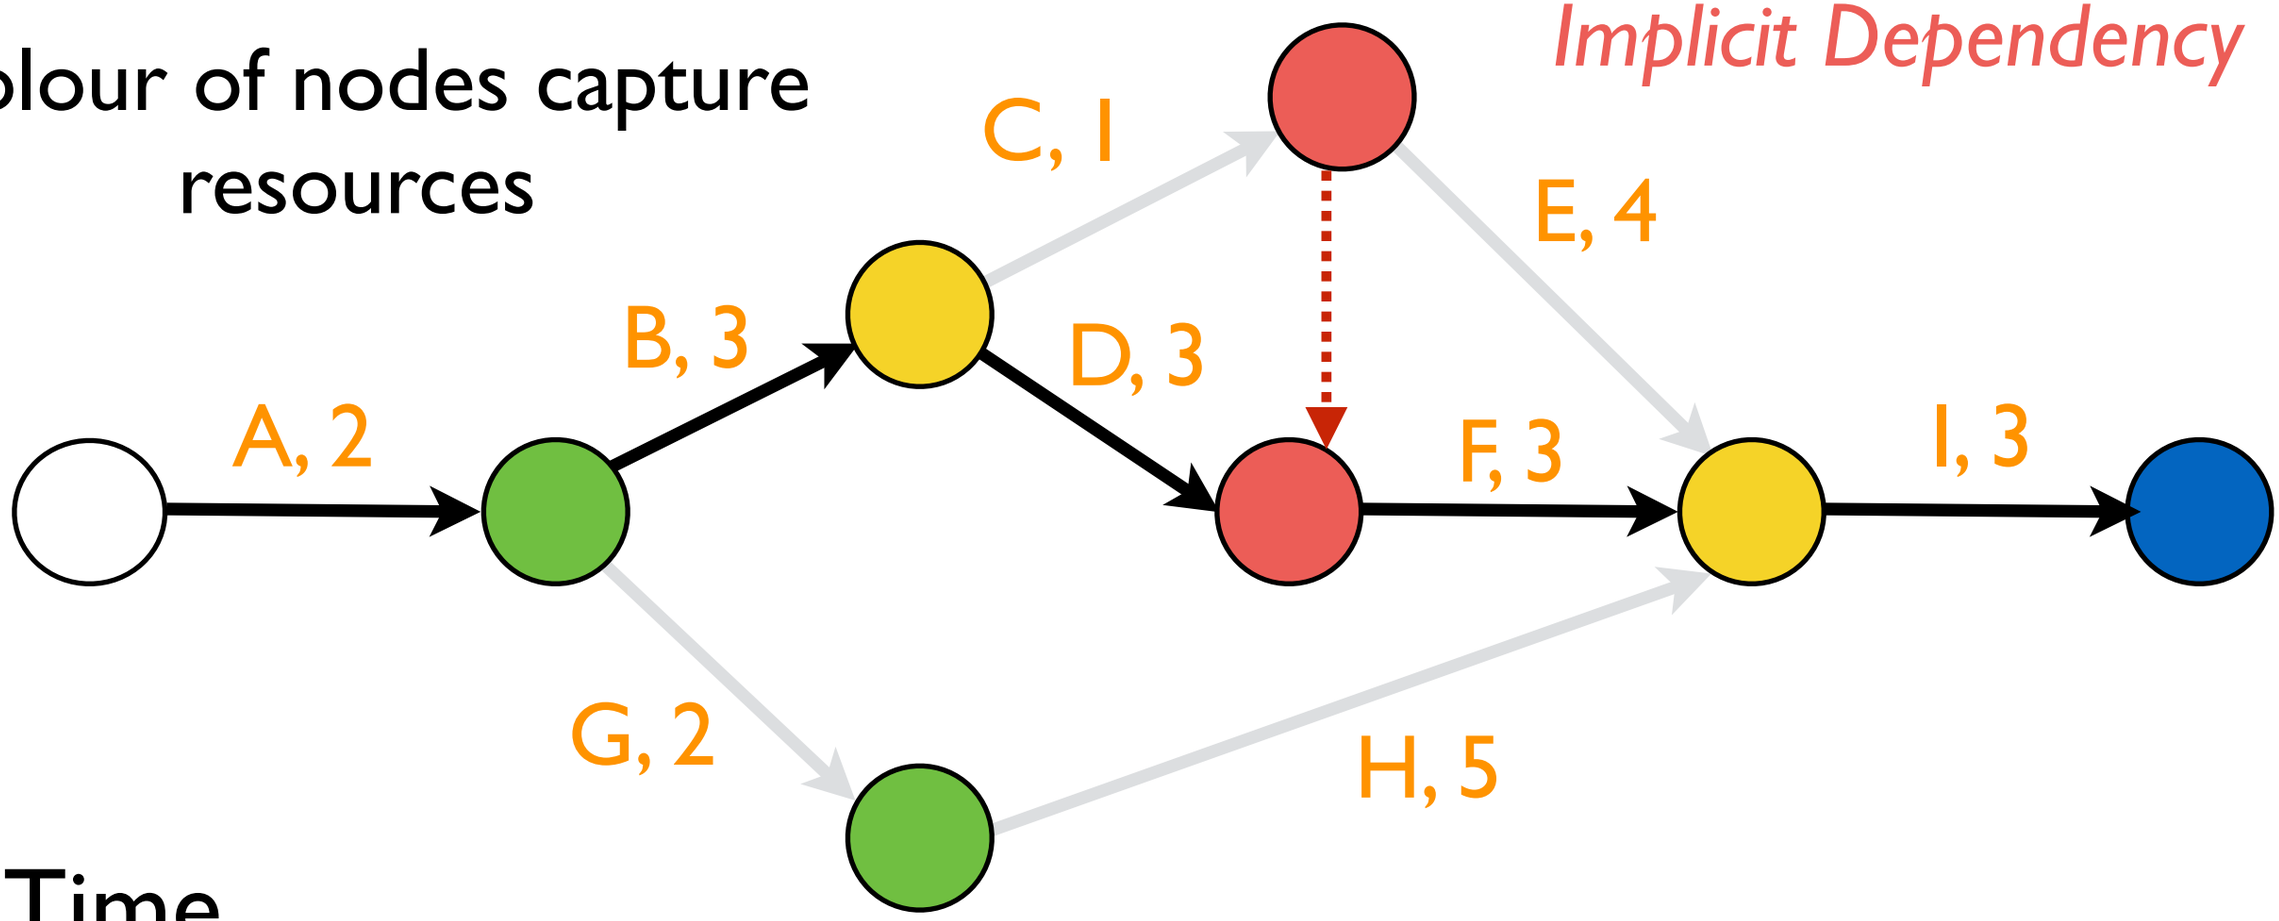
Time



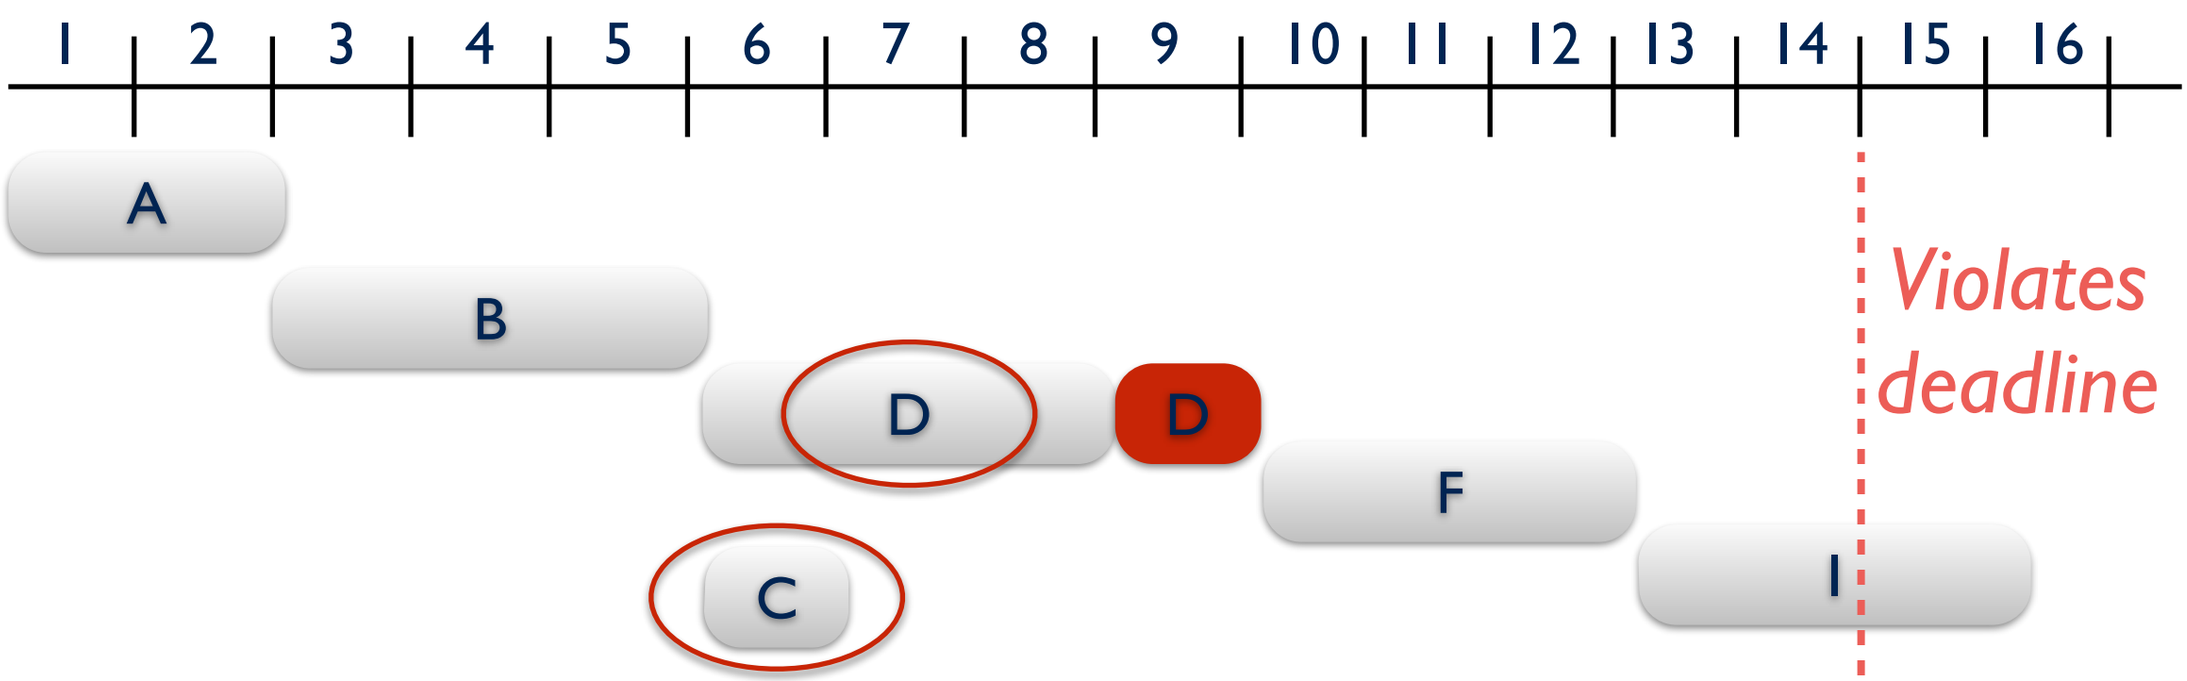
Wait!!!

Colour of nodes capture resources

Implicit Dependency

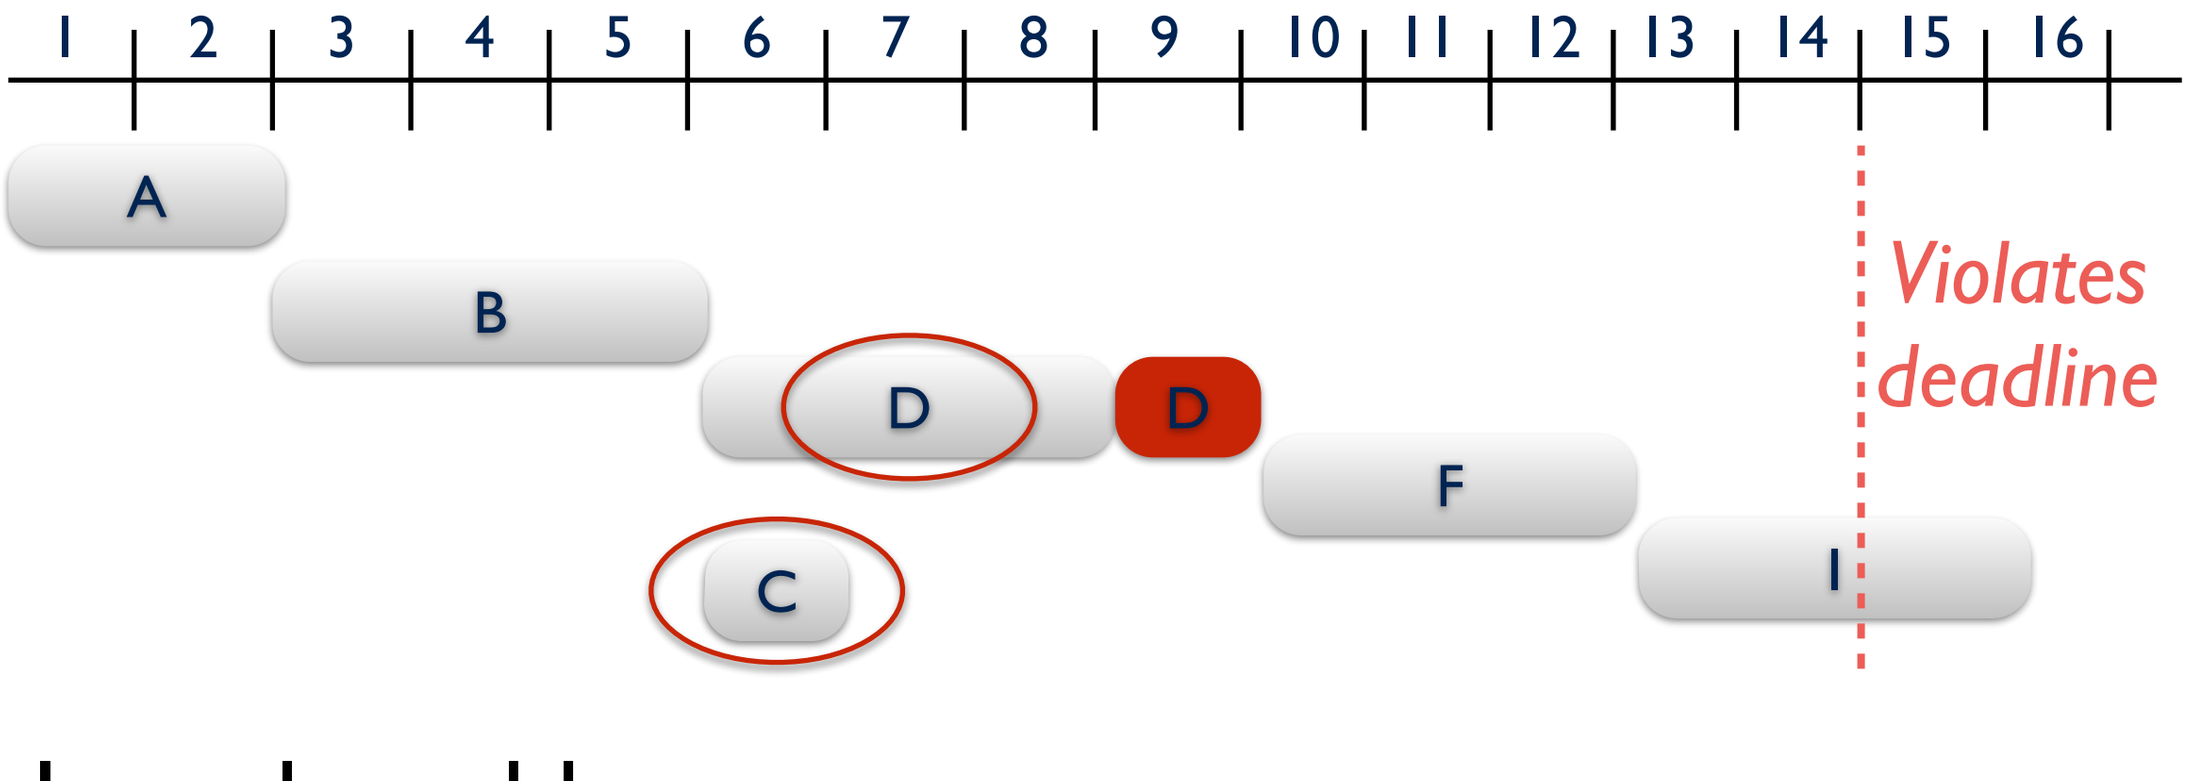


Time



Violates deadline

Critical Path



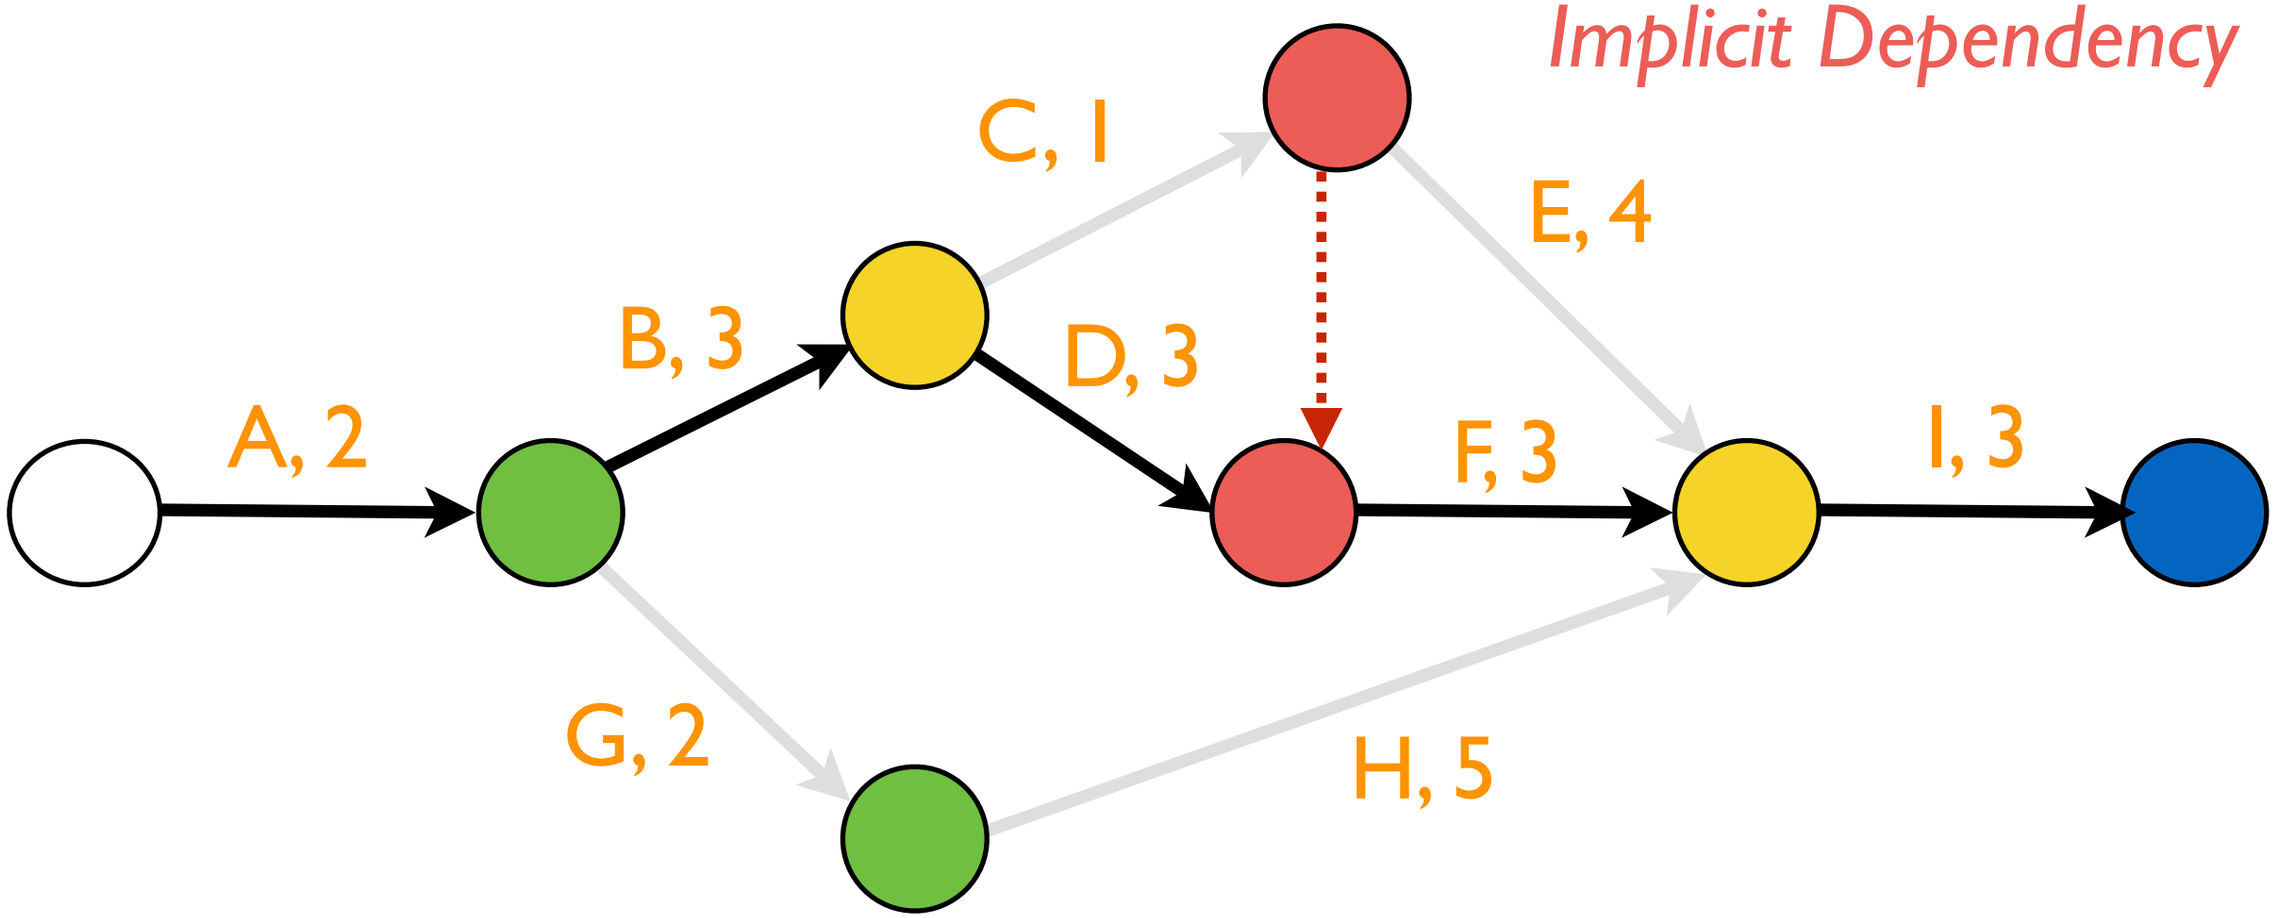
In real world

- we have finite resources
- project inevitably gets delayed
  - student syndrome (procastination)
  - murphy's law (whatever can go wrong, will)
  - parkinson's law (delaying completion of task)

Critical chain

- Explicit resource
- Explicit buffer
  - project buffer
  - feed buffer
  - resource buffer

Critical path vs chain

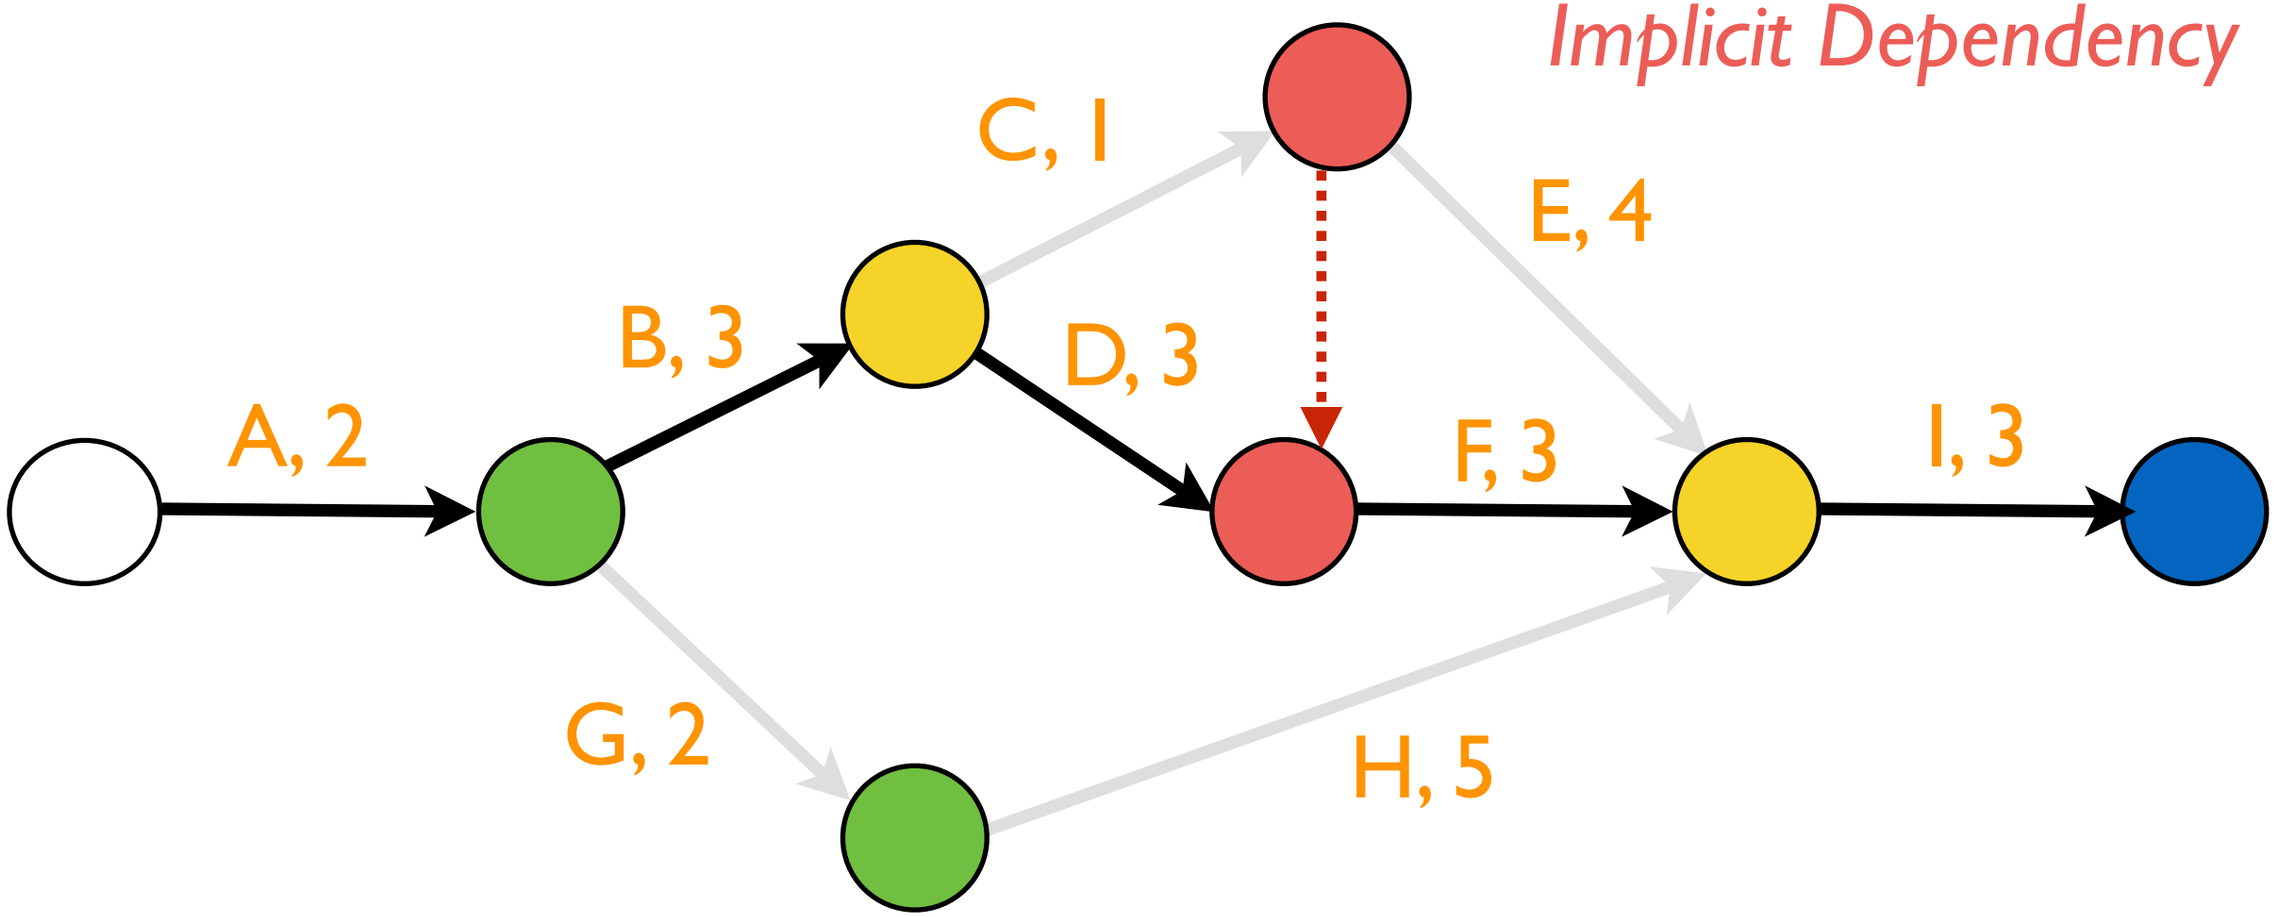


Critical path: A-B-D-F-I

Critical chain: A-B-C-D-F-I

When is critical chain the same as critical path?

Critical path vs chain

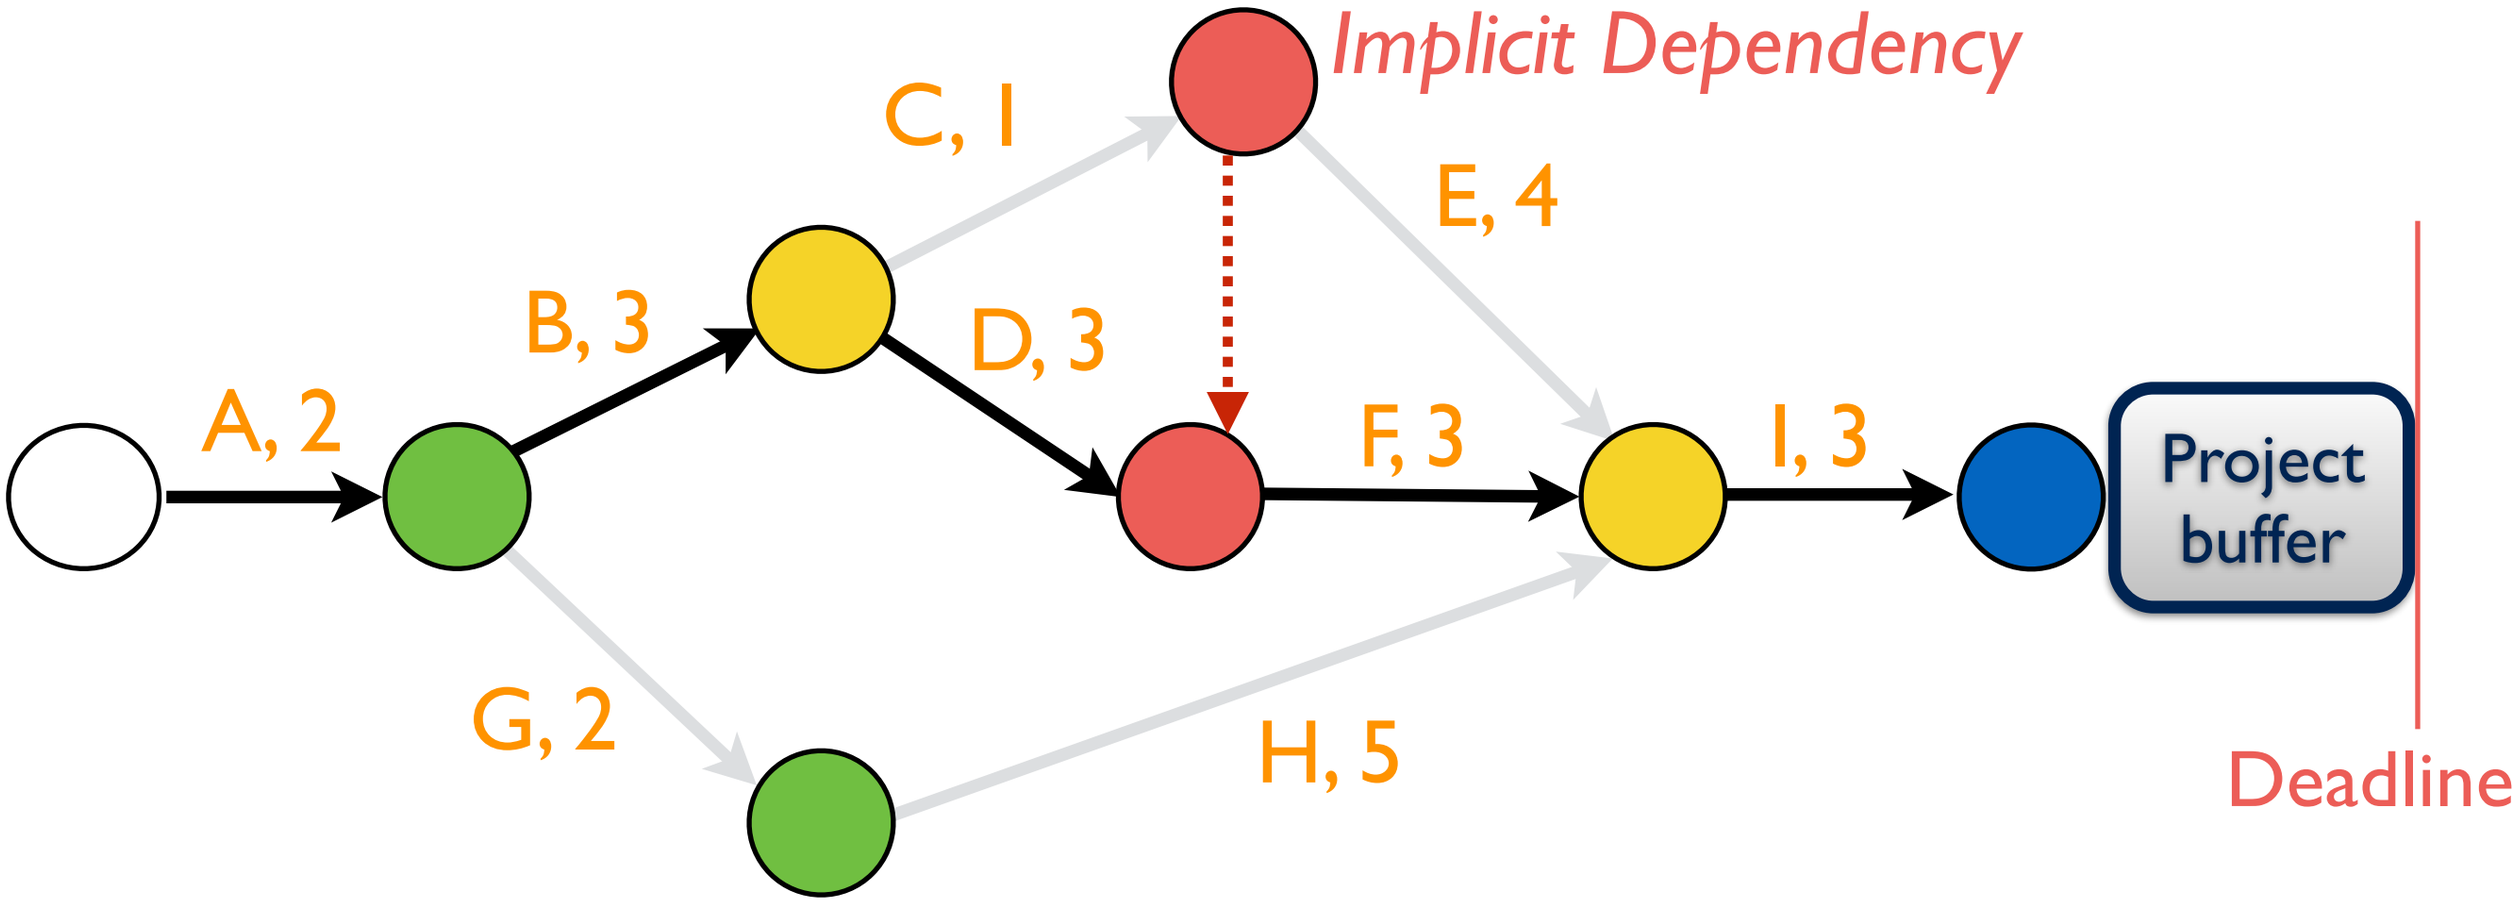


Critical path: track progress of individual task

Critical chain: track progress of buffers

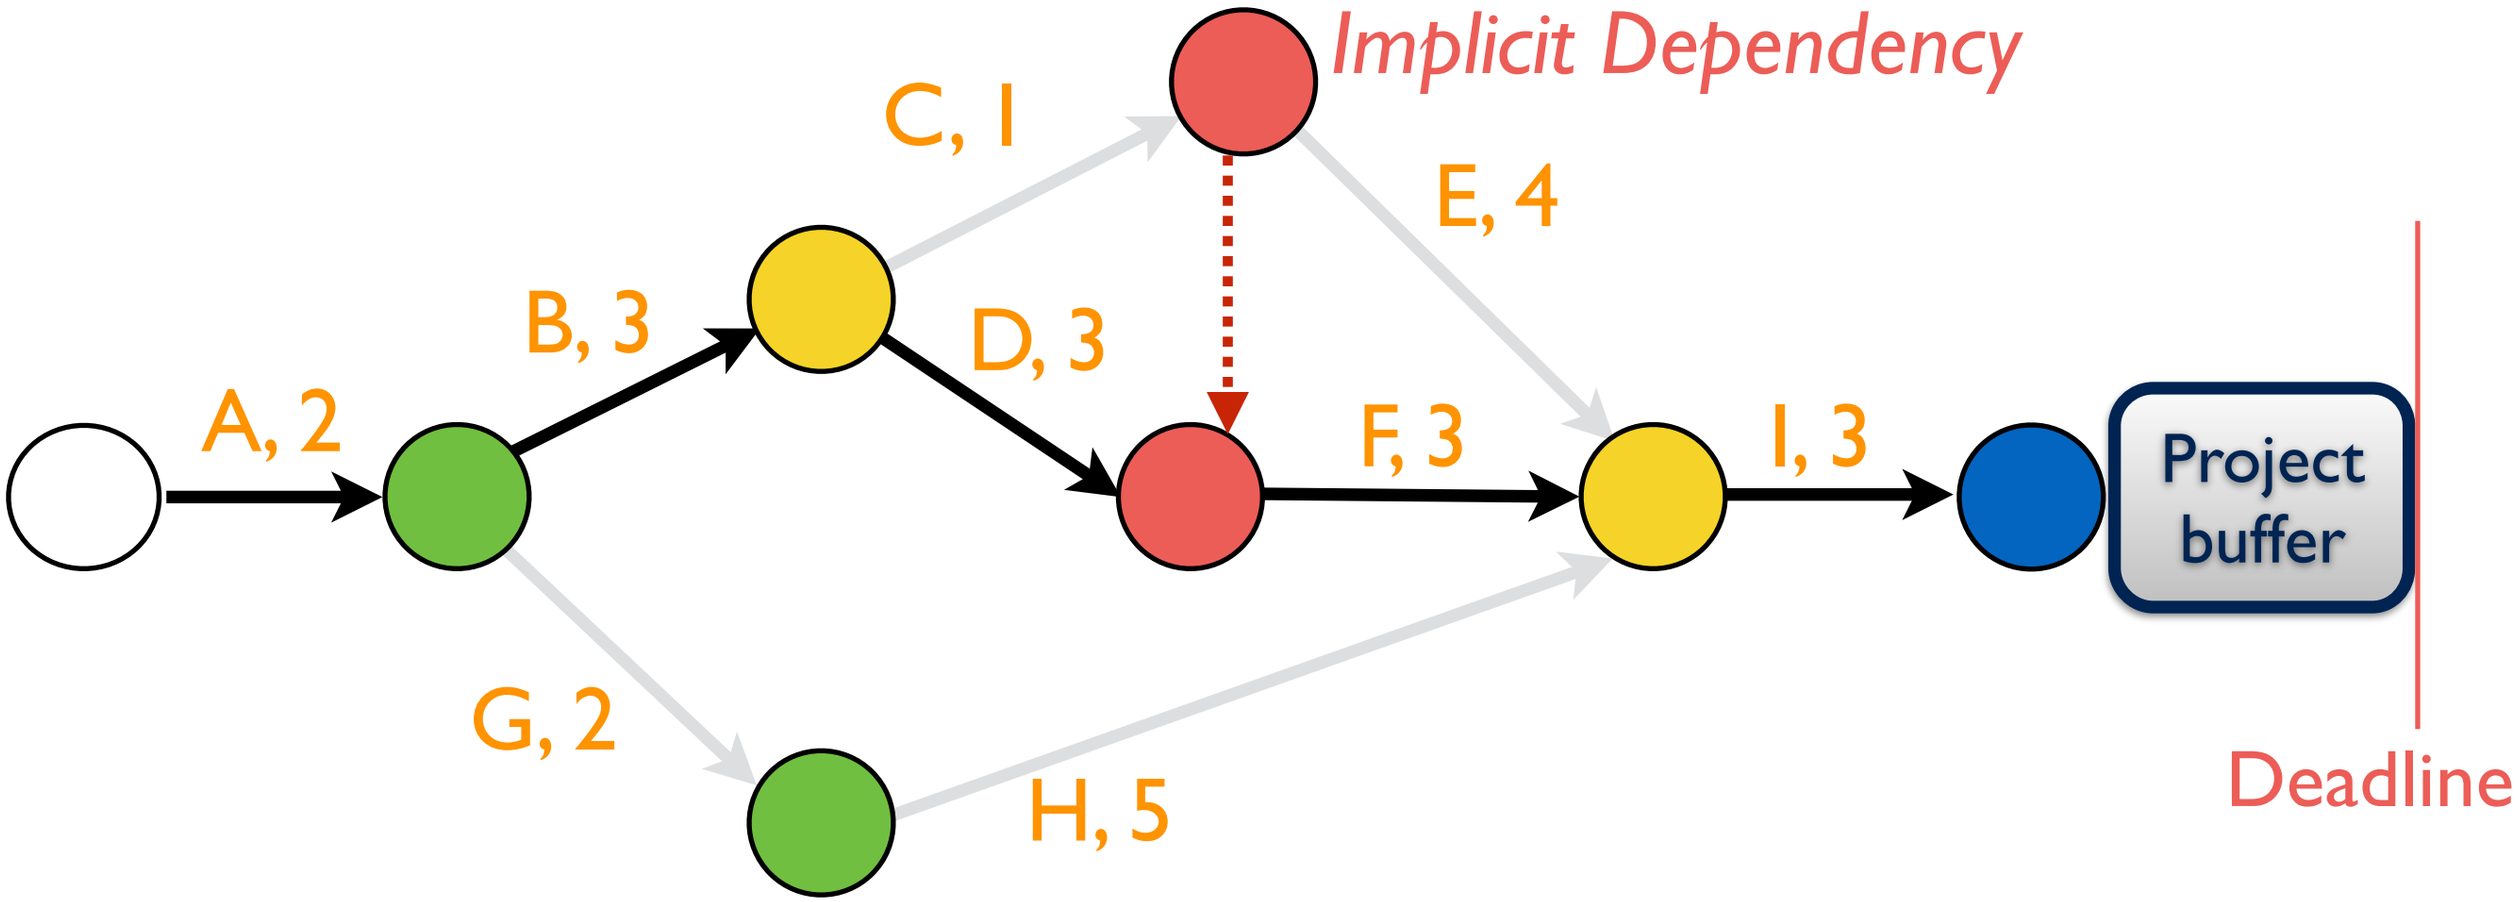
Why? (let's revisit it)

Critical chain buffers



Project buffer between the final task and deadline

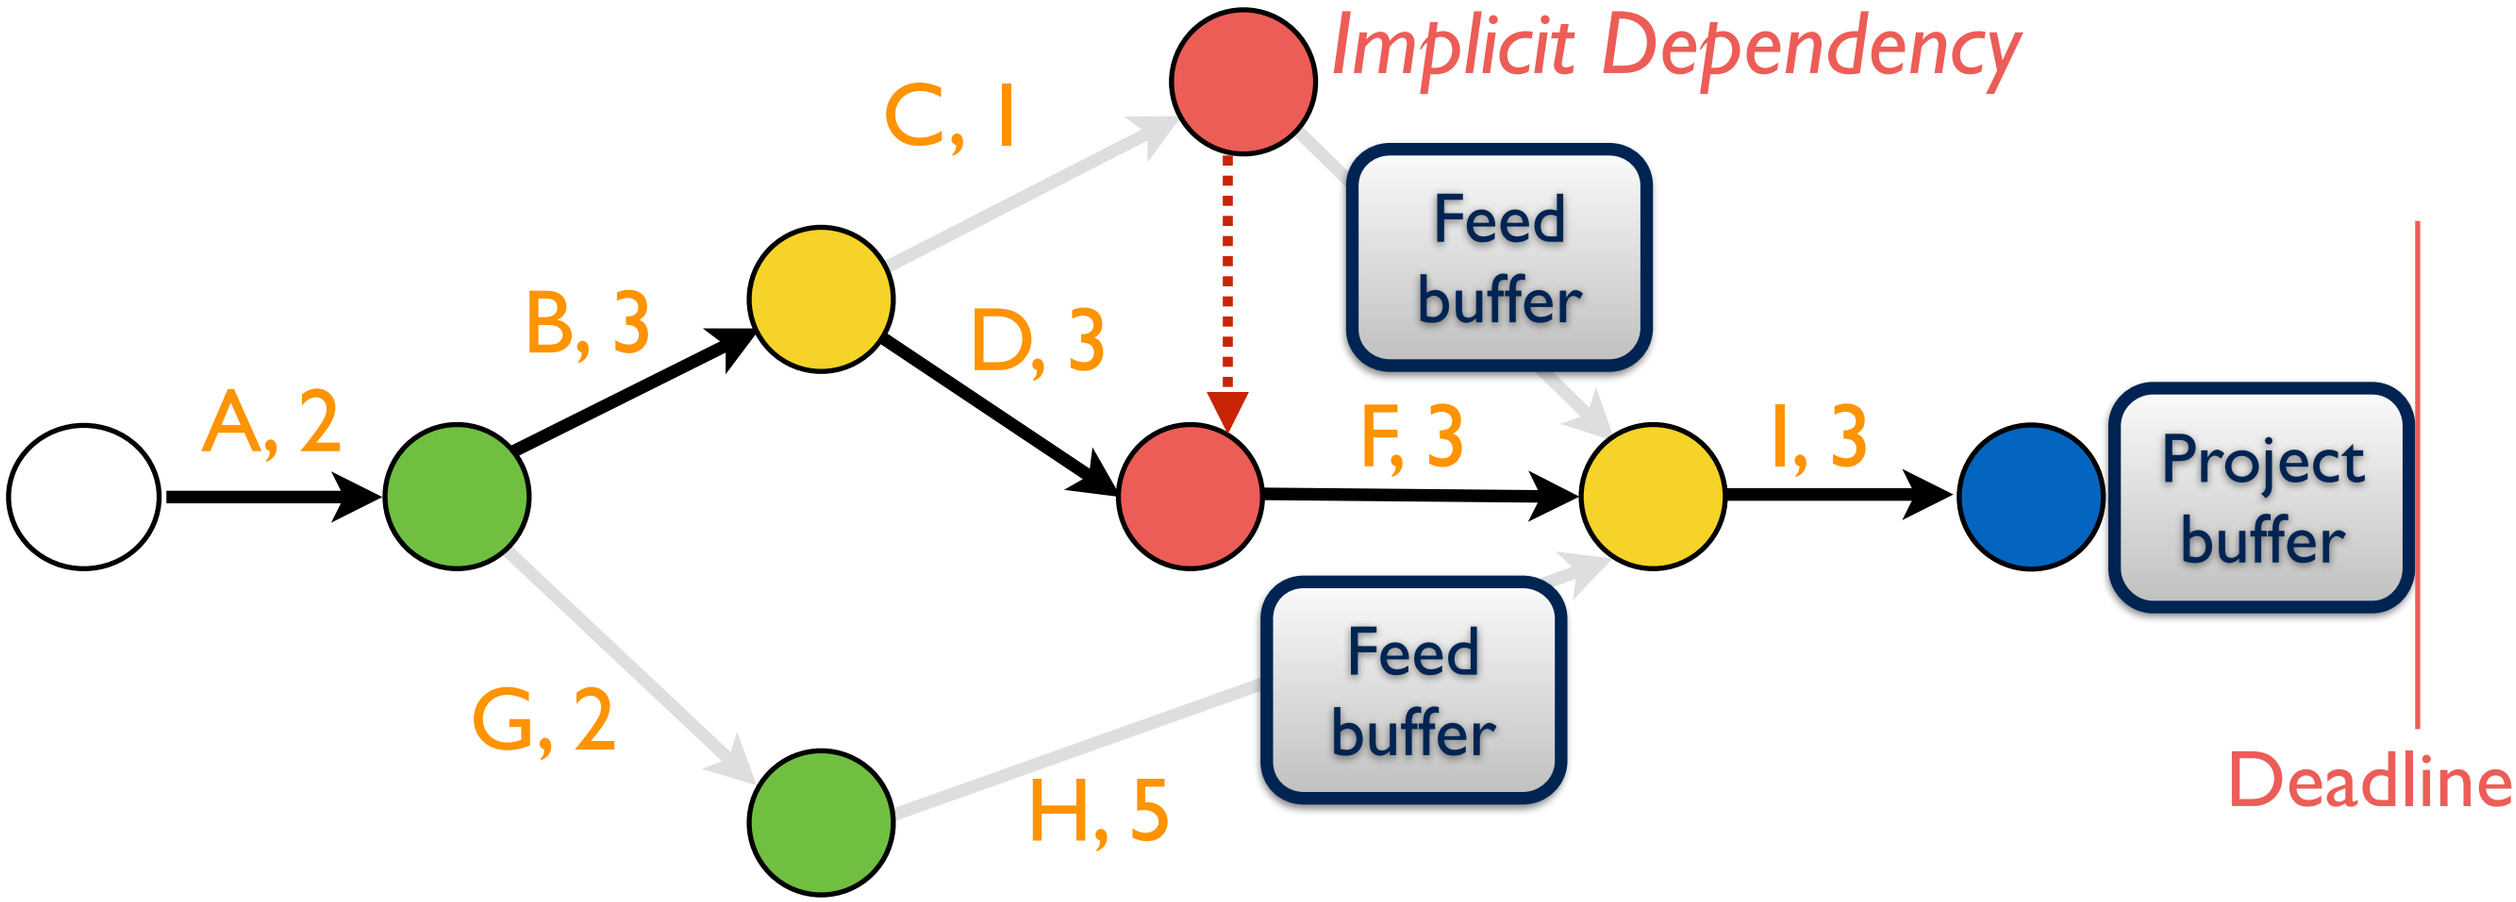
Critical chain buffers



Feeding chain: path of activities merging into critical chain

Feeding buffer: placed at the merge point

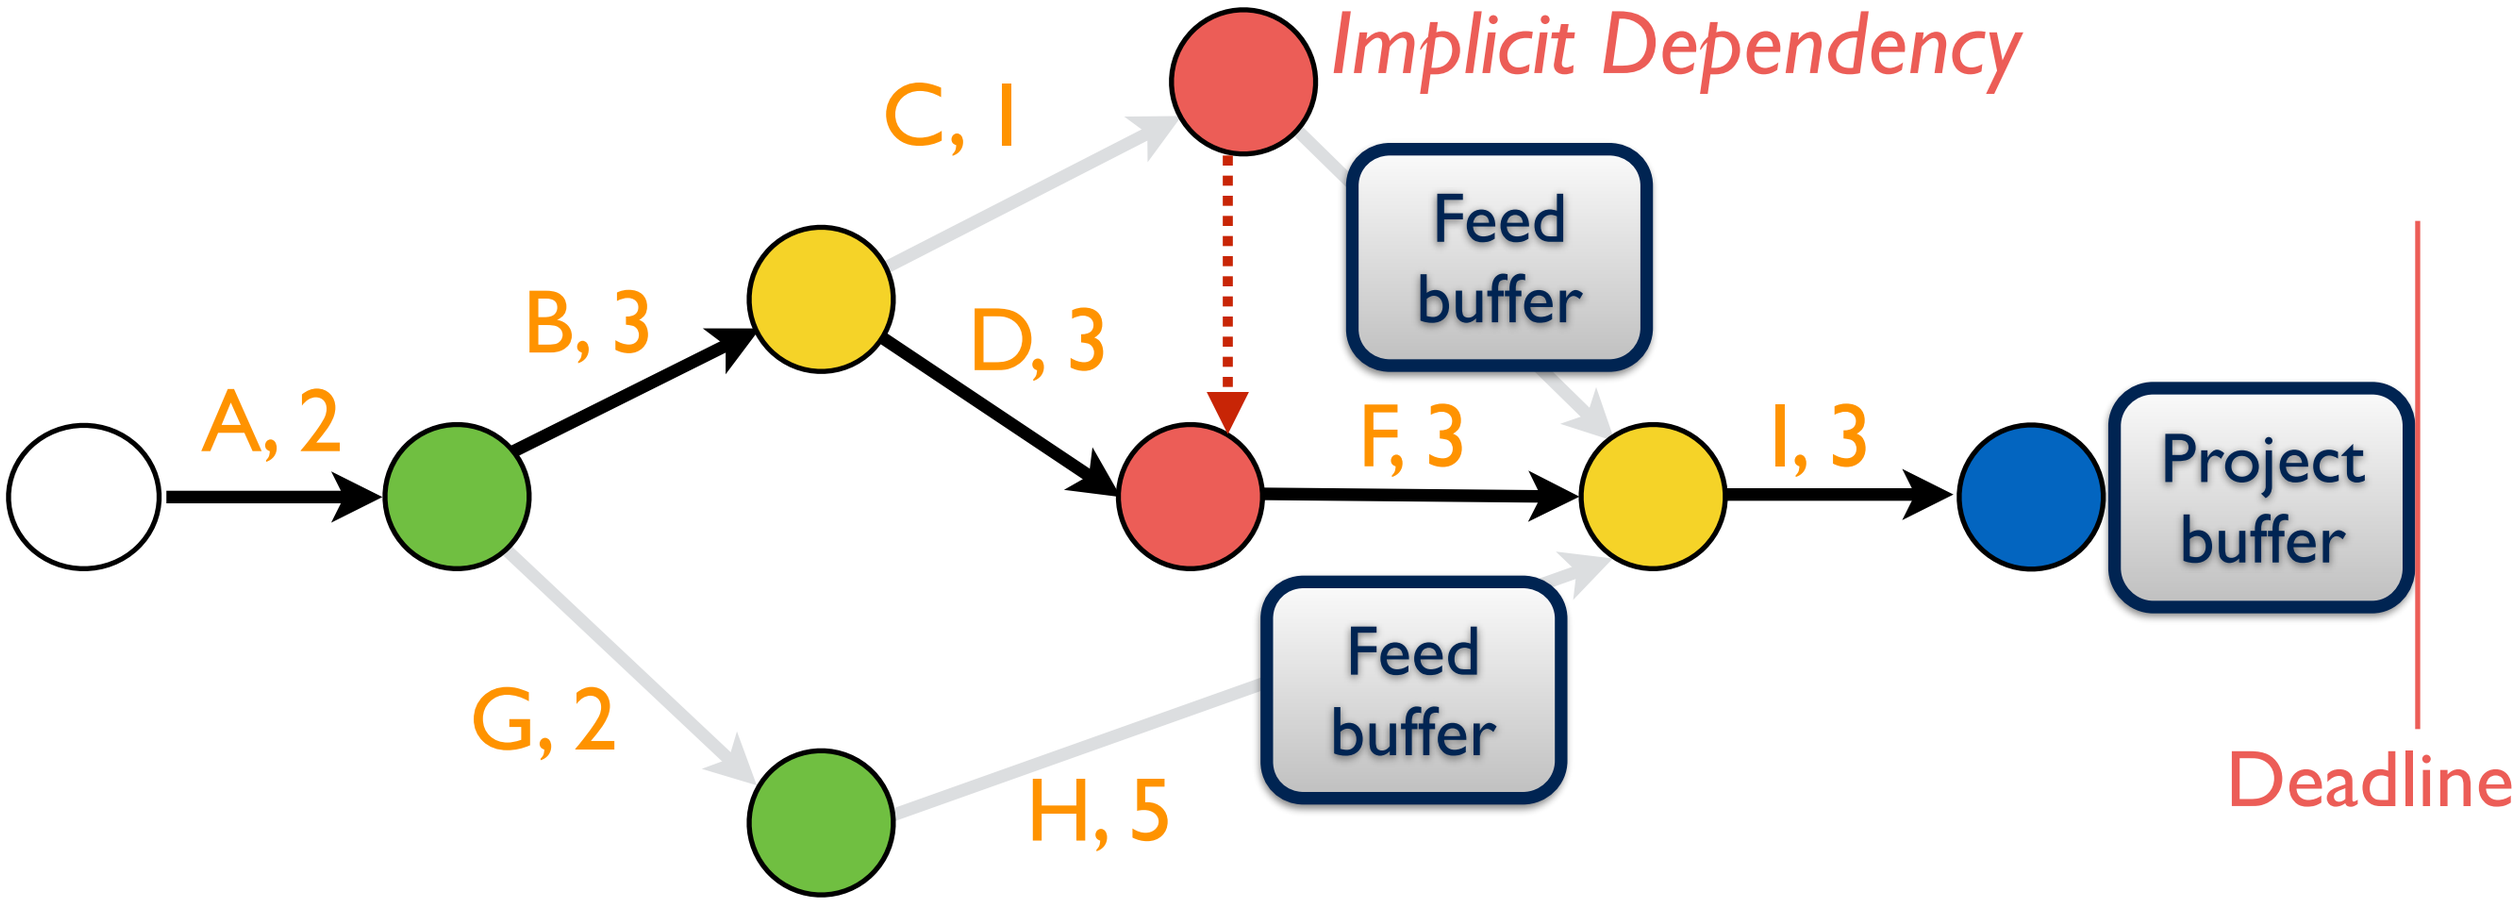
Critical chain buffers



Feeding chain: path of activities merging into critical chain

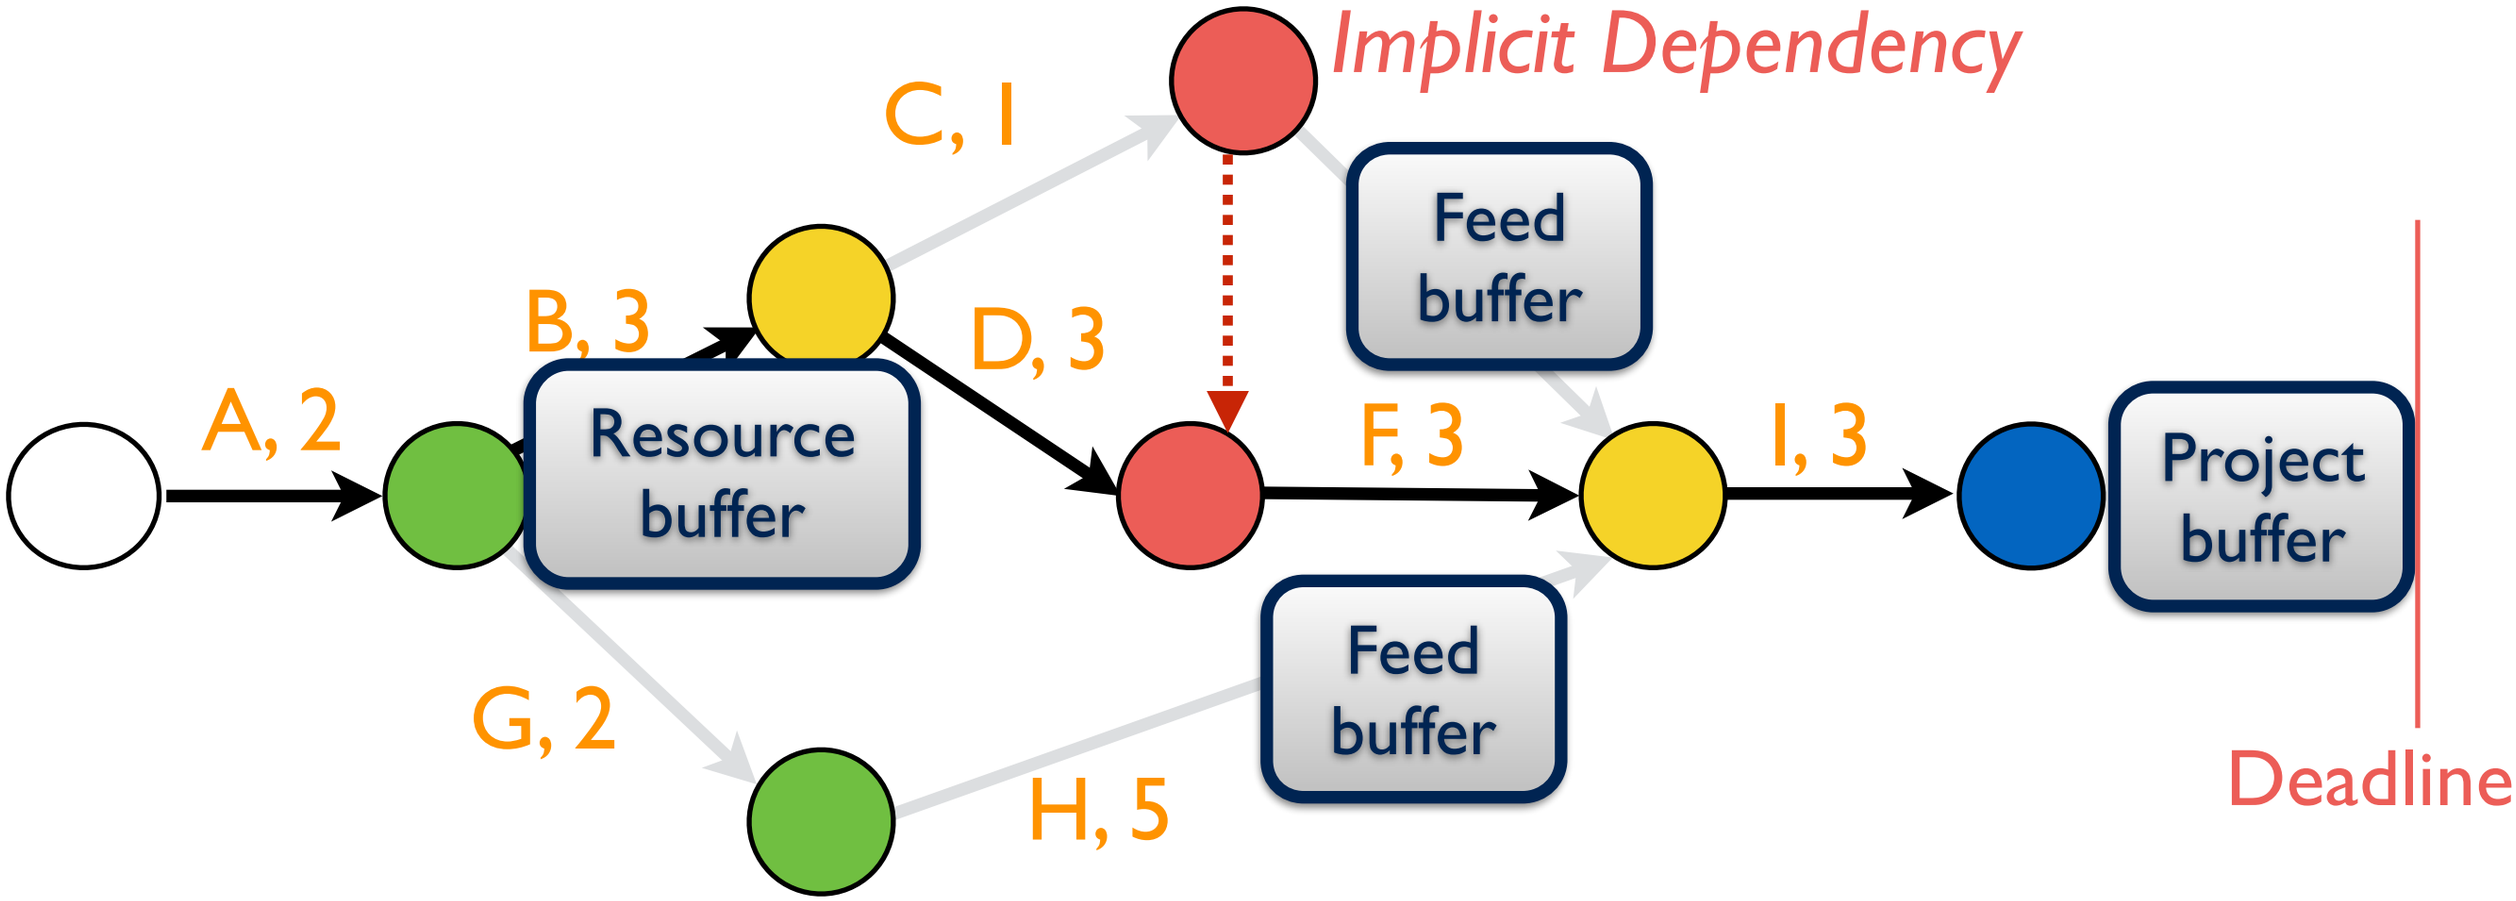
Feeding buffer: placed at the merge point

Critical chain buffers



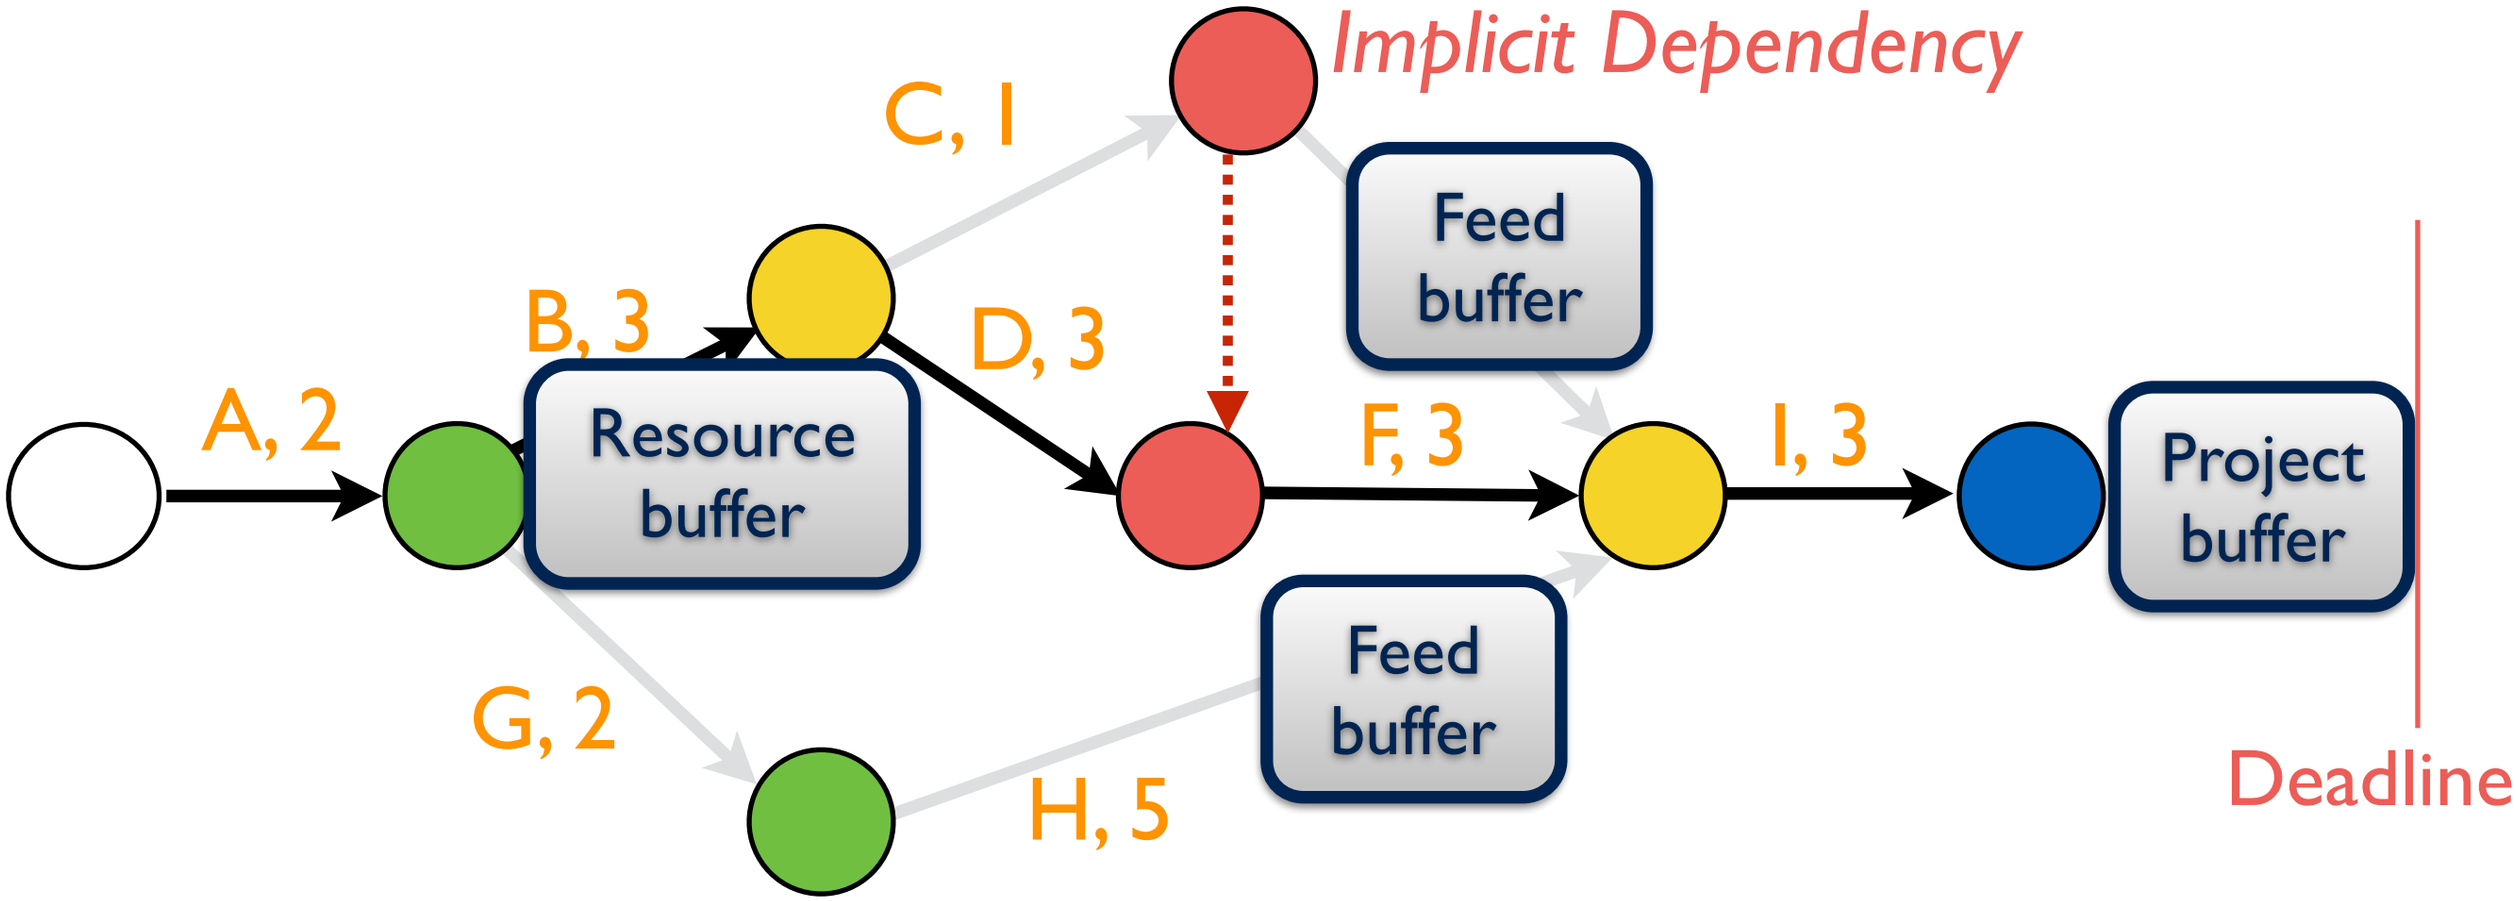
Resource buffer:
timely availability of resource in the critical chain

Critical chain buffers



Resource buffer:
timely availability of resource in the critical chain

Critical chain buffers



Critical chain: why track progress of buffers?

Risk Management

He who will not risk cannot win (John Paul Jones, 1791).

Types of Risks

- Project risks threaten the *project plan*.
  Causes project to slip and increase cost.
- Technical risks threaten the *quality* and *timeliness* of the project.
  Causes implementation to become difficult or impossible.
- Business risks threaten the *viability* of the project to be built.
  Causes project to be irrelevant or redundant.

Types of Risks

- Known risks are those that can be uncovered during careful evaluation of the project, and the business and technical environment
  (e.g. unrealistic delivery data, lack of documented requirements).
- Predictable risks can be extrapolated by past experience/projects
  (e.g. poor productivity or communication).
- Unpredictable risks are those that are difficult to identify
  (e.g. manager falls of a horse).

Risk Management

Types of Risks

- Generic risks
- Product-specific risks

Risk Management

Similar story with software development!

Risk Table

Risk	Category	Probability	Impact	RMMM
Size estimate low	PS	20%	2	
Change in req.	PS	45%	3	
Lack of training	DE	15%	2	
Staff inexperienced	ST	40%	4	
Delivery deadline tightened	BU	60%	5	

Impact values:

1 - catastrophic
2 - critical
3 - marginal
4 - negligible

Assessing Risk Impact

Risk Exposure (RE) = P x C

P = probability of risk
C = cost if the risk occurs

RMMM

Risk Mitigation, Monitoring & Management

- Risk avoidance (prevention better than cure)
- Risk monitoring
    - monitor and collect information for future risk analysis
- Risk management and contingency plans.
    - Risk has become a live problem

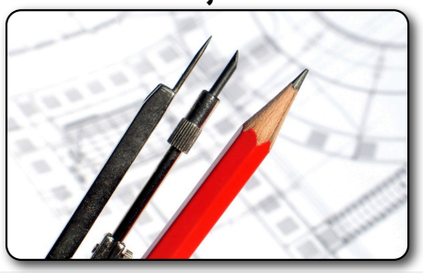
Four Ps of Project Management

People

Product

Process

Project



Software Project Management

Caper Jones

...the most interesting aspect of these six problem areas is that all are associated with project management rather than with technical personnel.

Summary

Project Scheduling

Risk Management

He who will not risk cannot win (John Paul Jones, 1791).
