project initiation

## 6.6 Map Series Tool

Use Case Description	
Summary	User generates one or more maps from a series of maps for a given boundary feature (compartment, landscape etc).
Actors	EIMS User
Pre-Conditions	User requires one or more maps sheets from a series, for a boundary feature.
Post-Conditions	Map or series of maps is generated and printed
Priority	Required

### Scenario

1) User starts the tool.

*System displays a list of map series that the user can select from. Default map series will be 'Landscape 1:7920'. Can be set at any scale.*

2) User selects map series on form.

*System then determines if any boundary features are selected.*

A. Features Selected:

i. *If features are selected, it asks the user to if they want to generate a map series for the selected feature. Only one feature can be used at a time.*

B. No Features Selected:

i. *If no features are selected, or user opts to select the feature manually, the system prompts the user to select the district and compartment of interest from pull downs. It then zooms to that location, generates the map sheet boundaries, draws them with the map sheet names.*

3) User can select individual sheets on screen, or select to print just an index map, or the entire series.

*System starts generating and printing maps based on the selected sheets.*

4) User collects maps from printer

### Notes

### Deployment

Tool in ArcMap and in ArcGIS Server

WATERFALL

# Waterfall Model

(1968)

Communication

project initiation

- Real projects rarely follow a sequential flow

Planning

estimating  
scheduling  
tracking

- Hard to state all requirements explicitly

Modeling

analysis  
design

- No maintenance or evolution involved

Construction

code  
test

- Customer must have patience

- Any blunder can be disastrous

Deployment

delivery  
support  
feedback

# Boehm's first law

Errors are most frequent during *requirements* and *design* activities and are the more expensive the later they are removed.

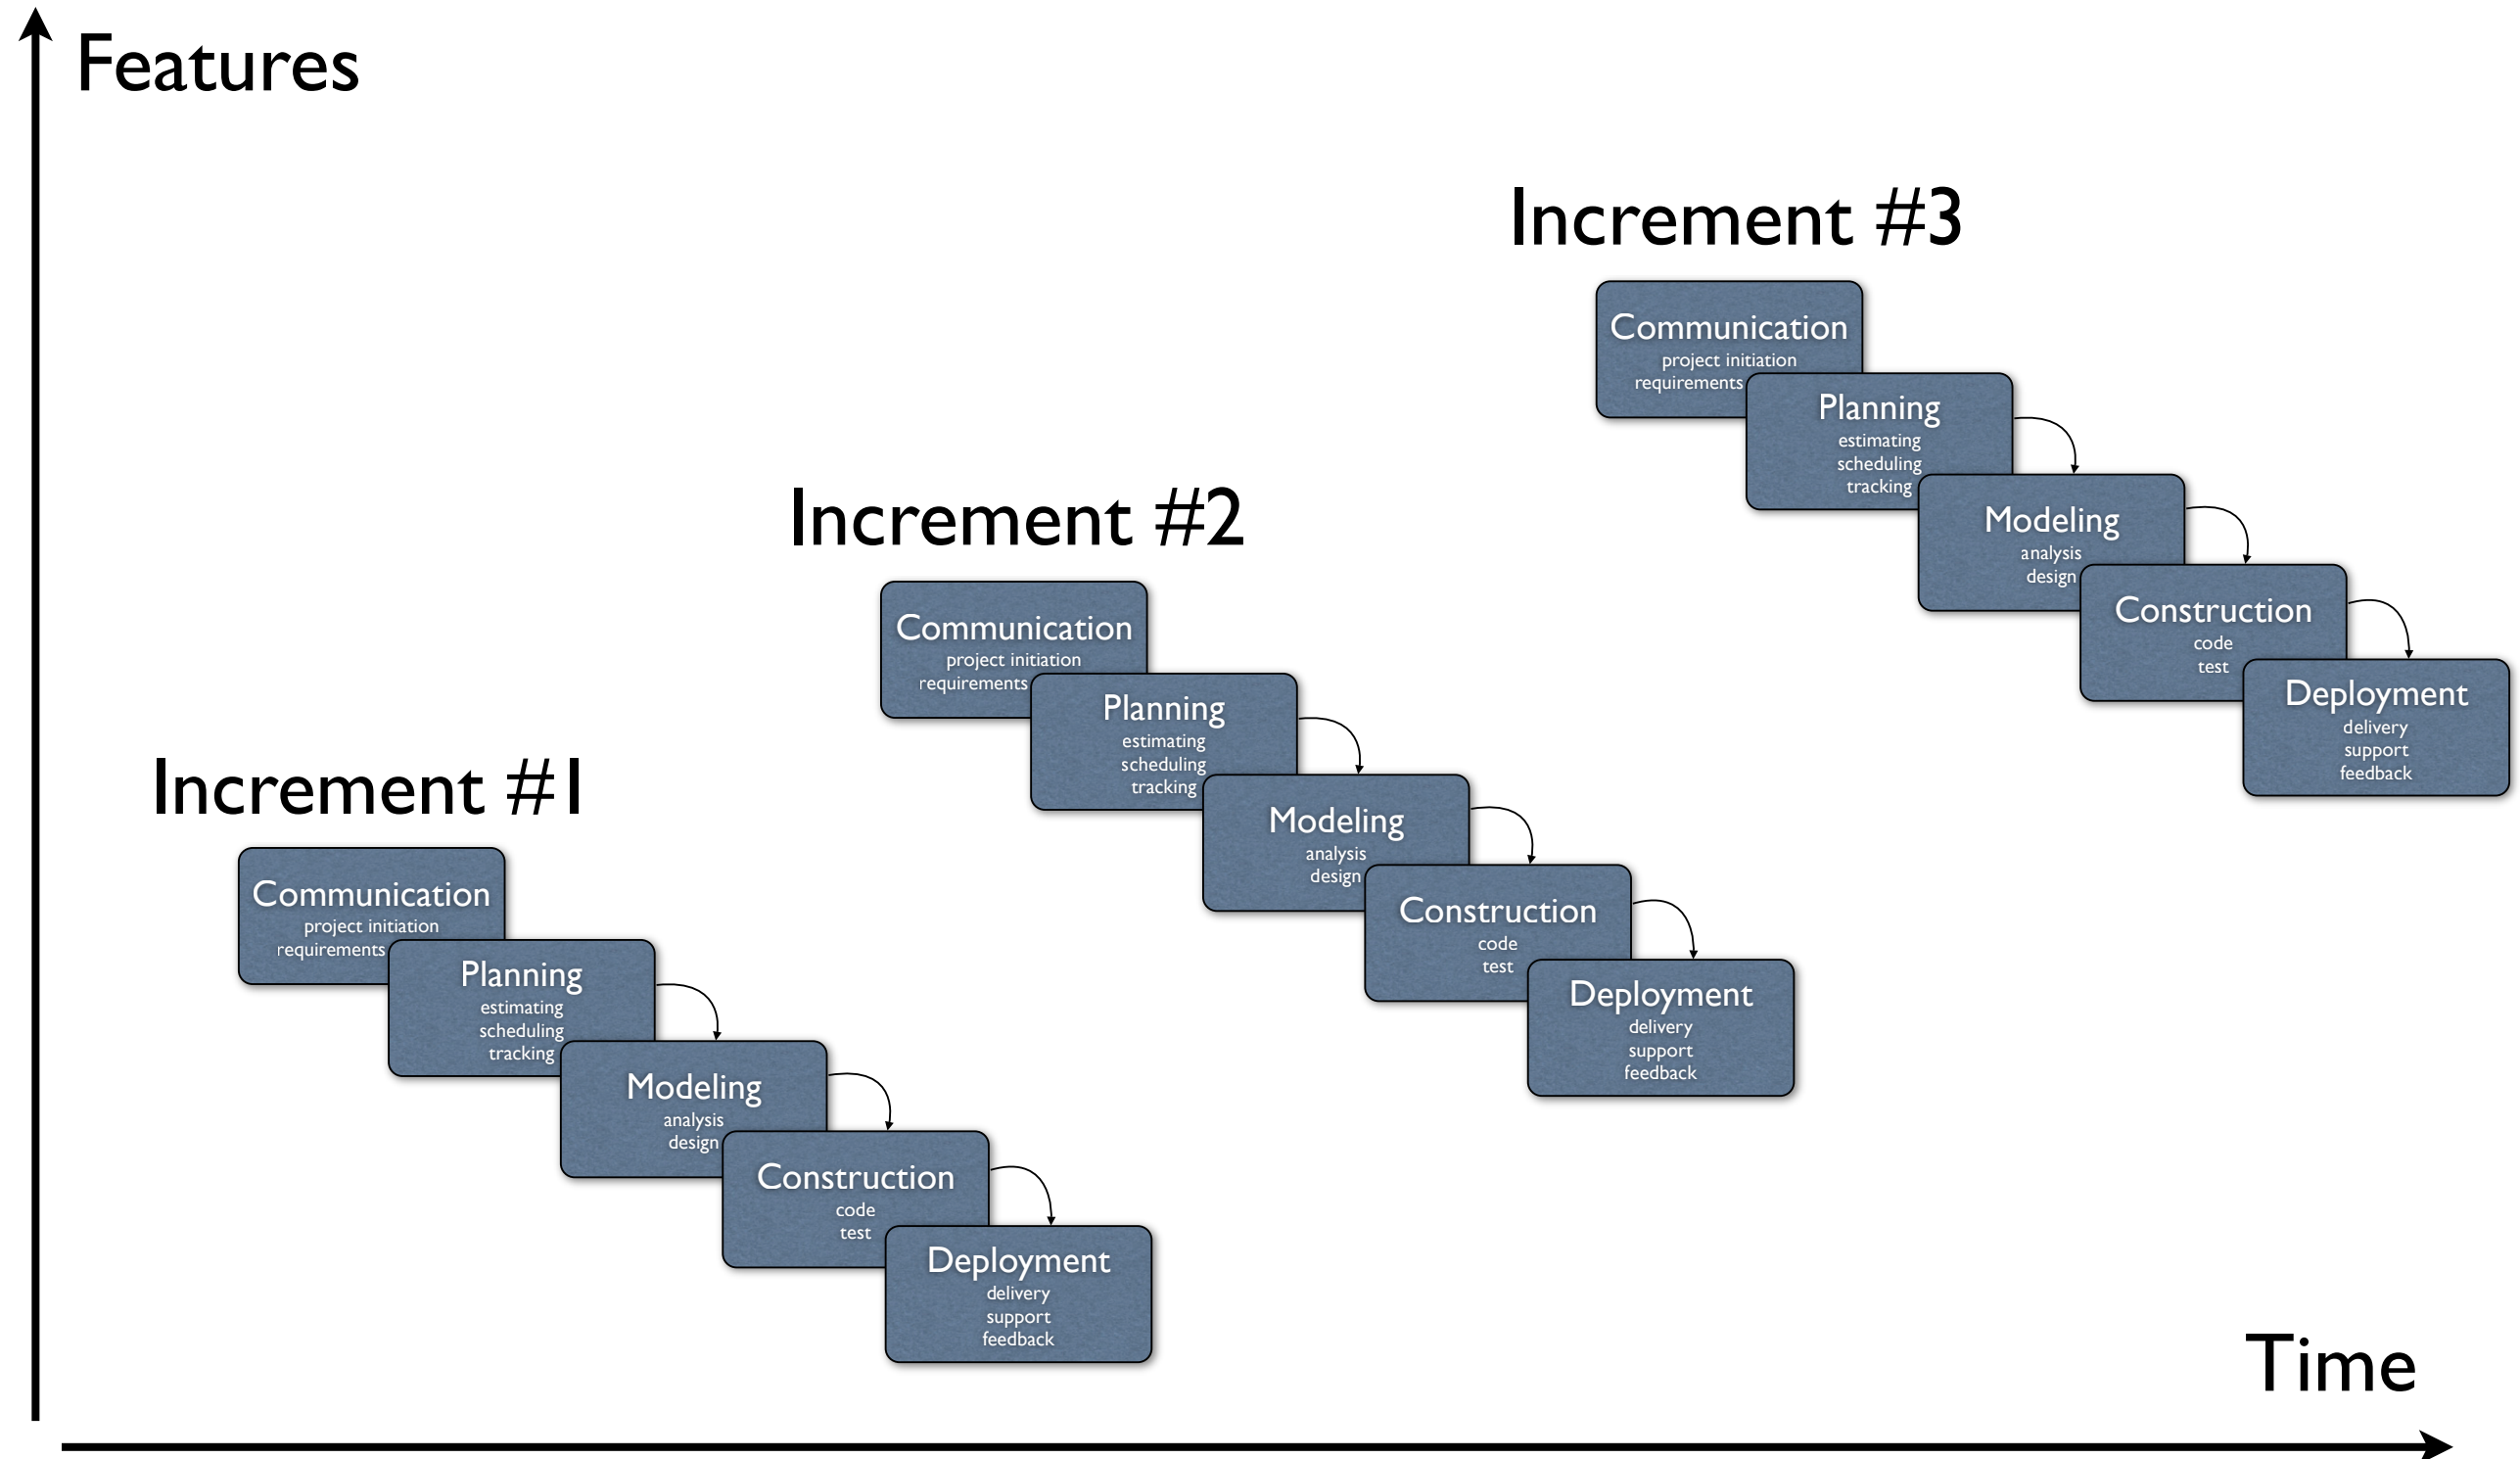

# Problem Cost

■ Relative cost of problem per phase

# Incremental Model

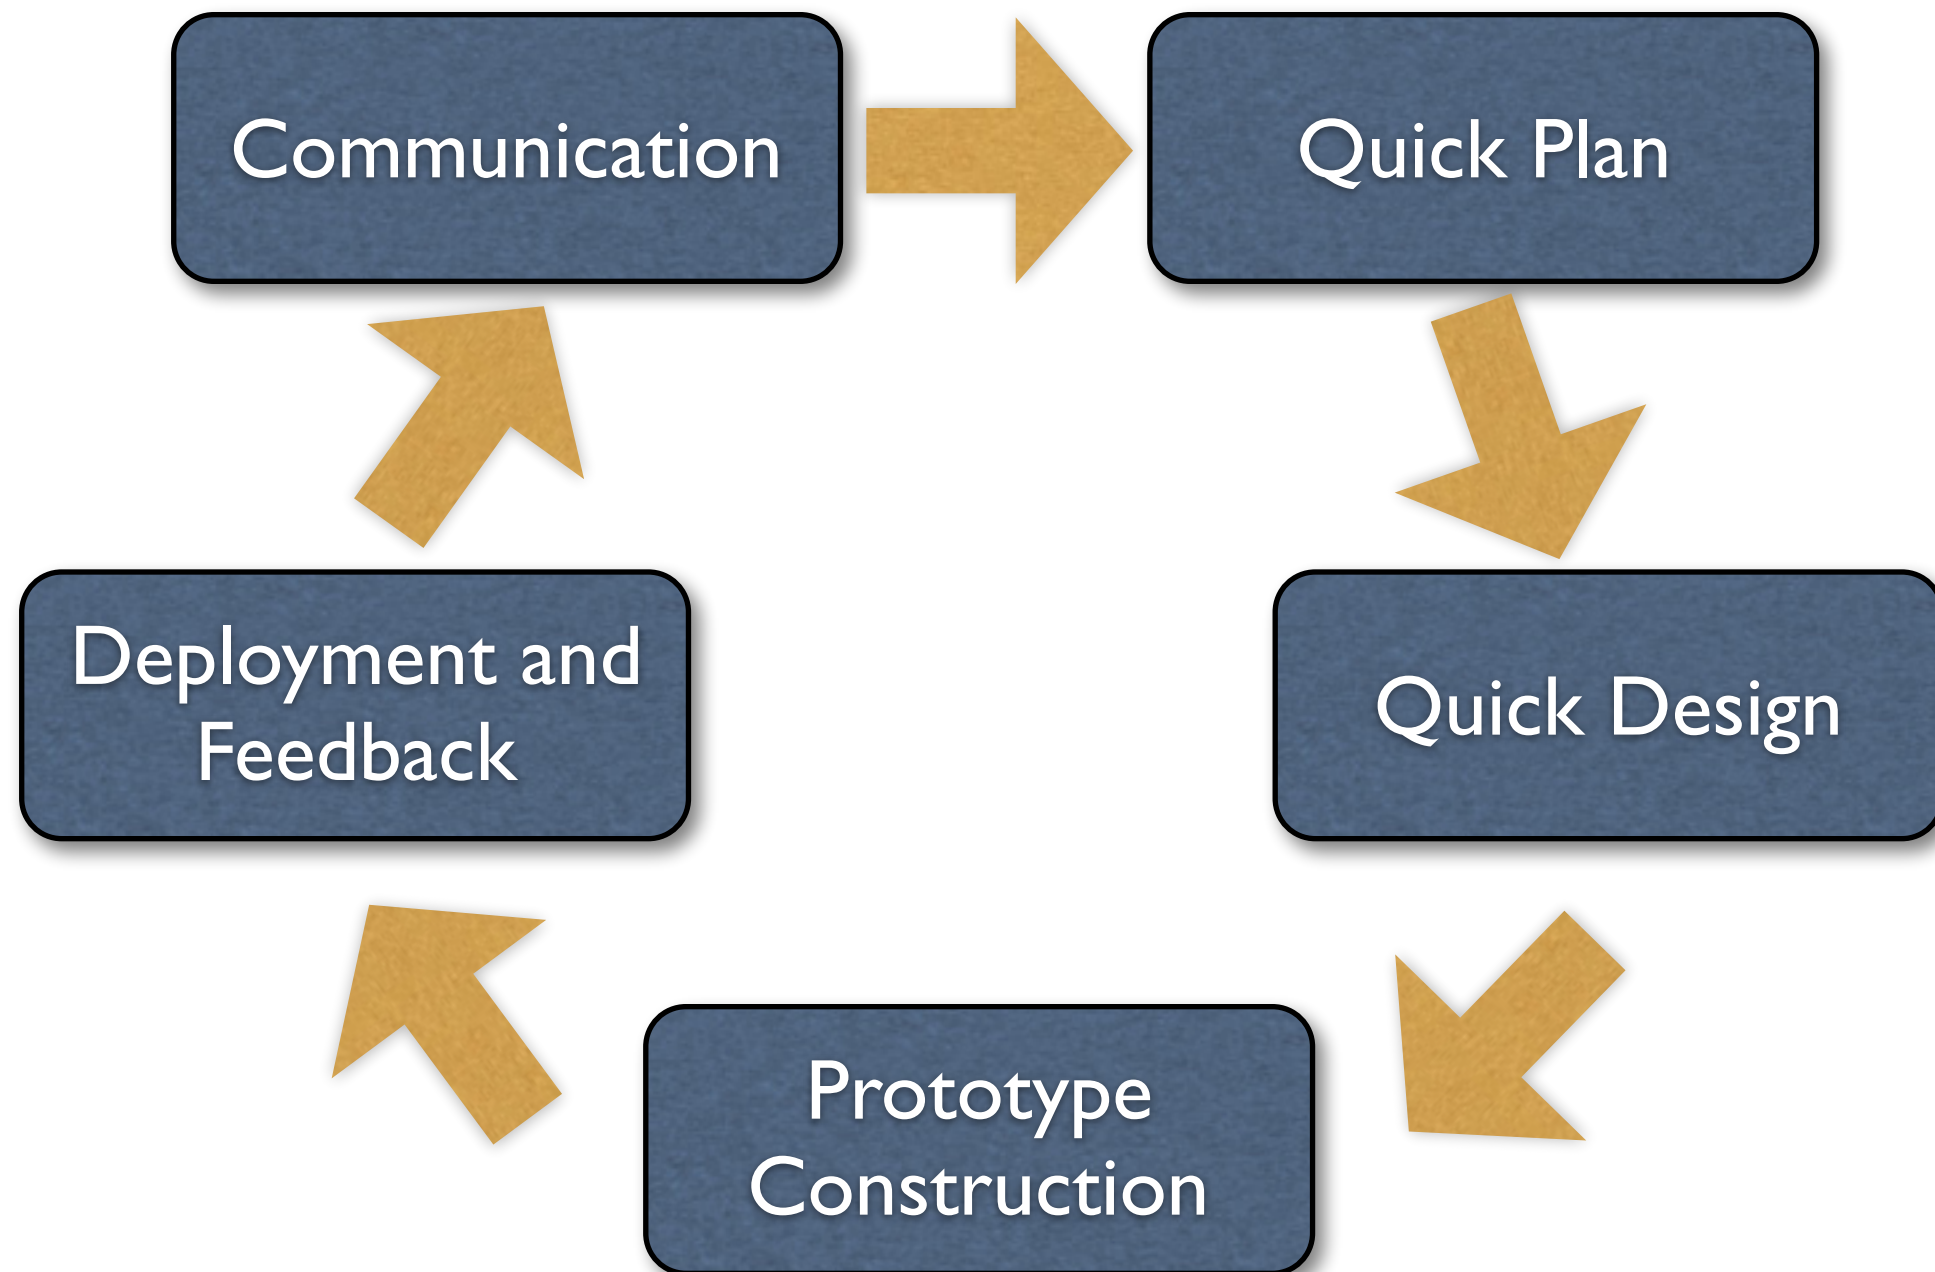

# Incremental Model

- Each linear sequence produces a particular “increment” to the software
- First increment typically core product; more features added by later increments
- Allows flexible allocation of resources

# Prototyping

# Prototypes

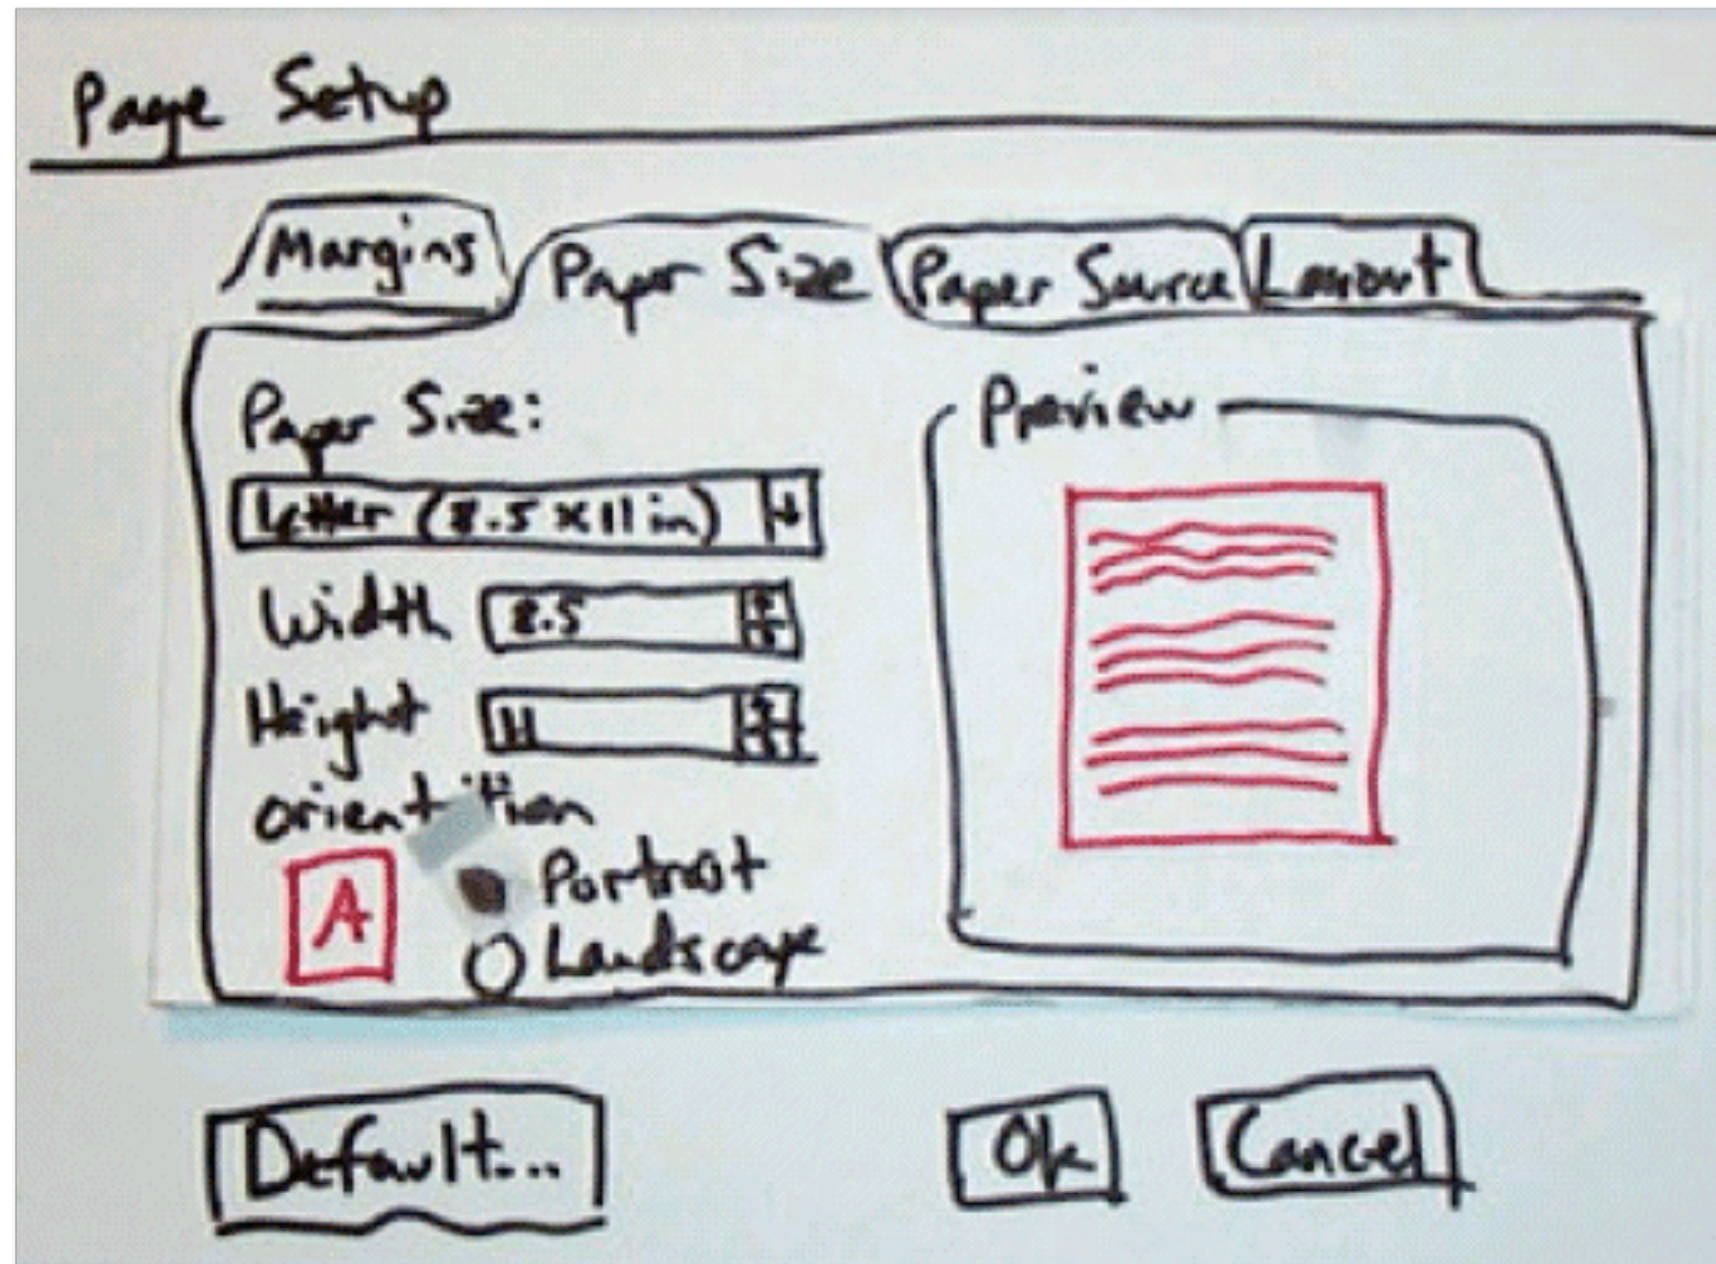

Top Layer (GUI)

Bottom Layer

# Horizontal Prototype

# Prototypes

Top Layer (GUI)

Bottom Layer

# Vertical Prototype

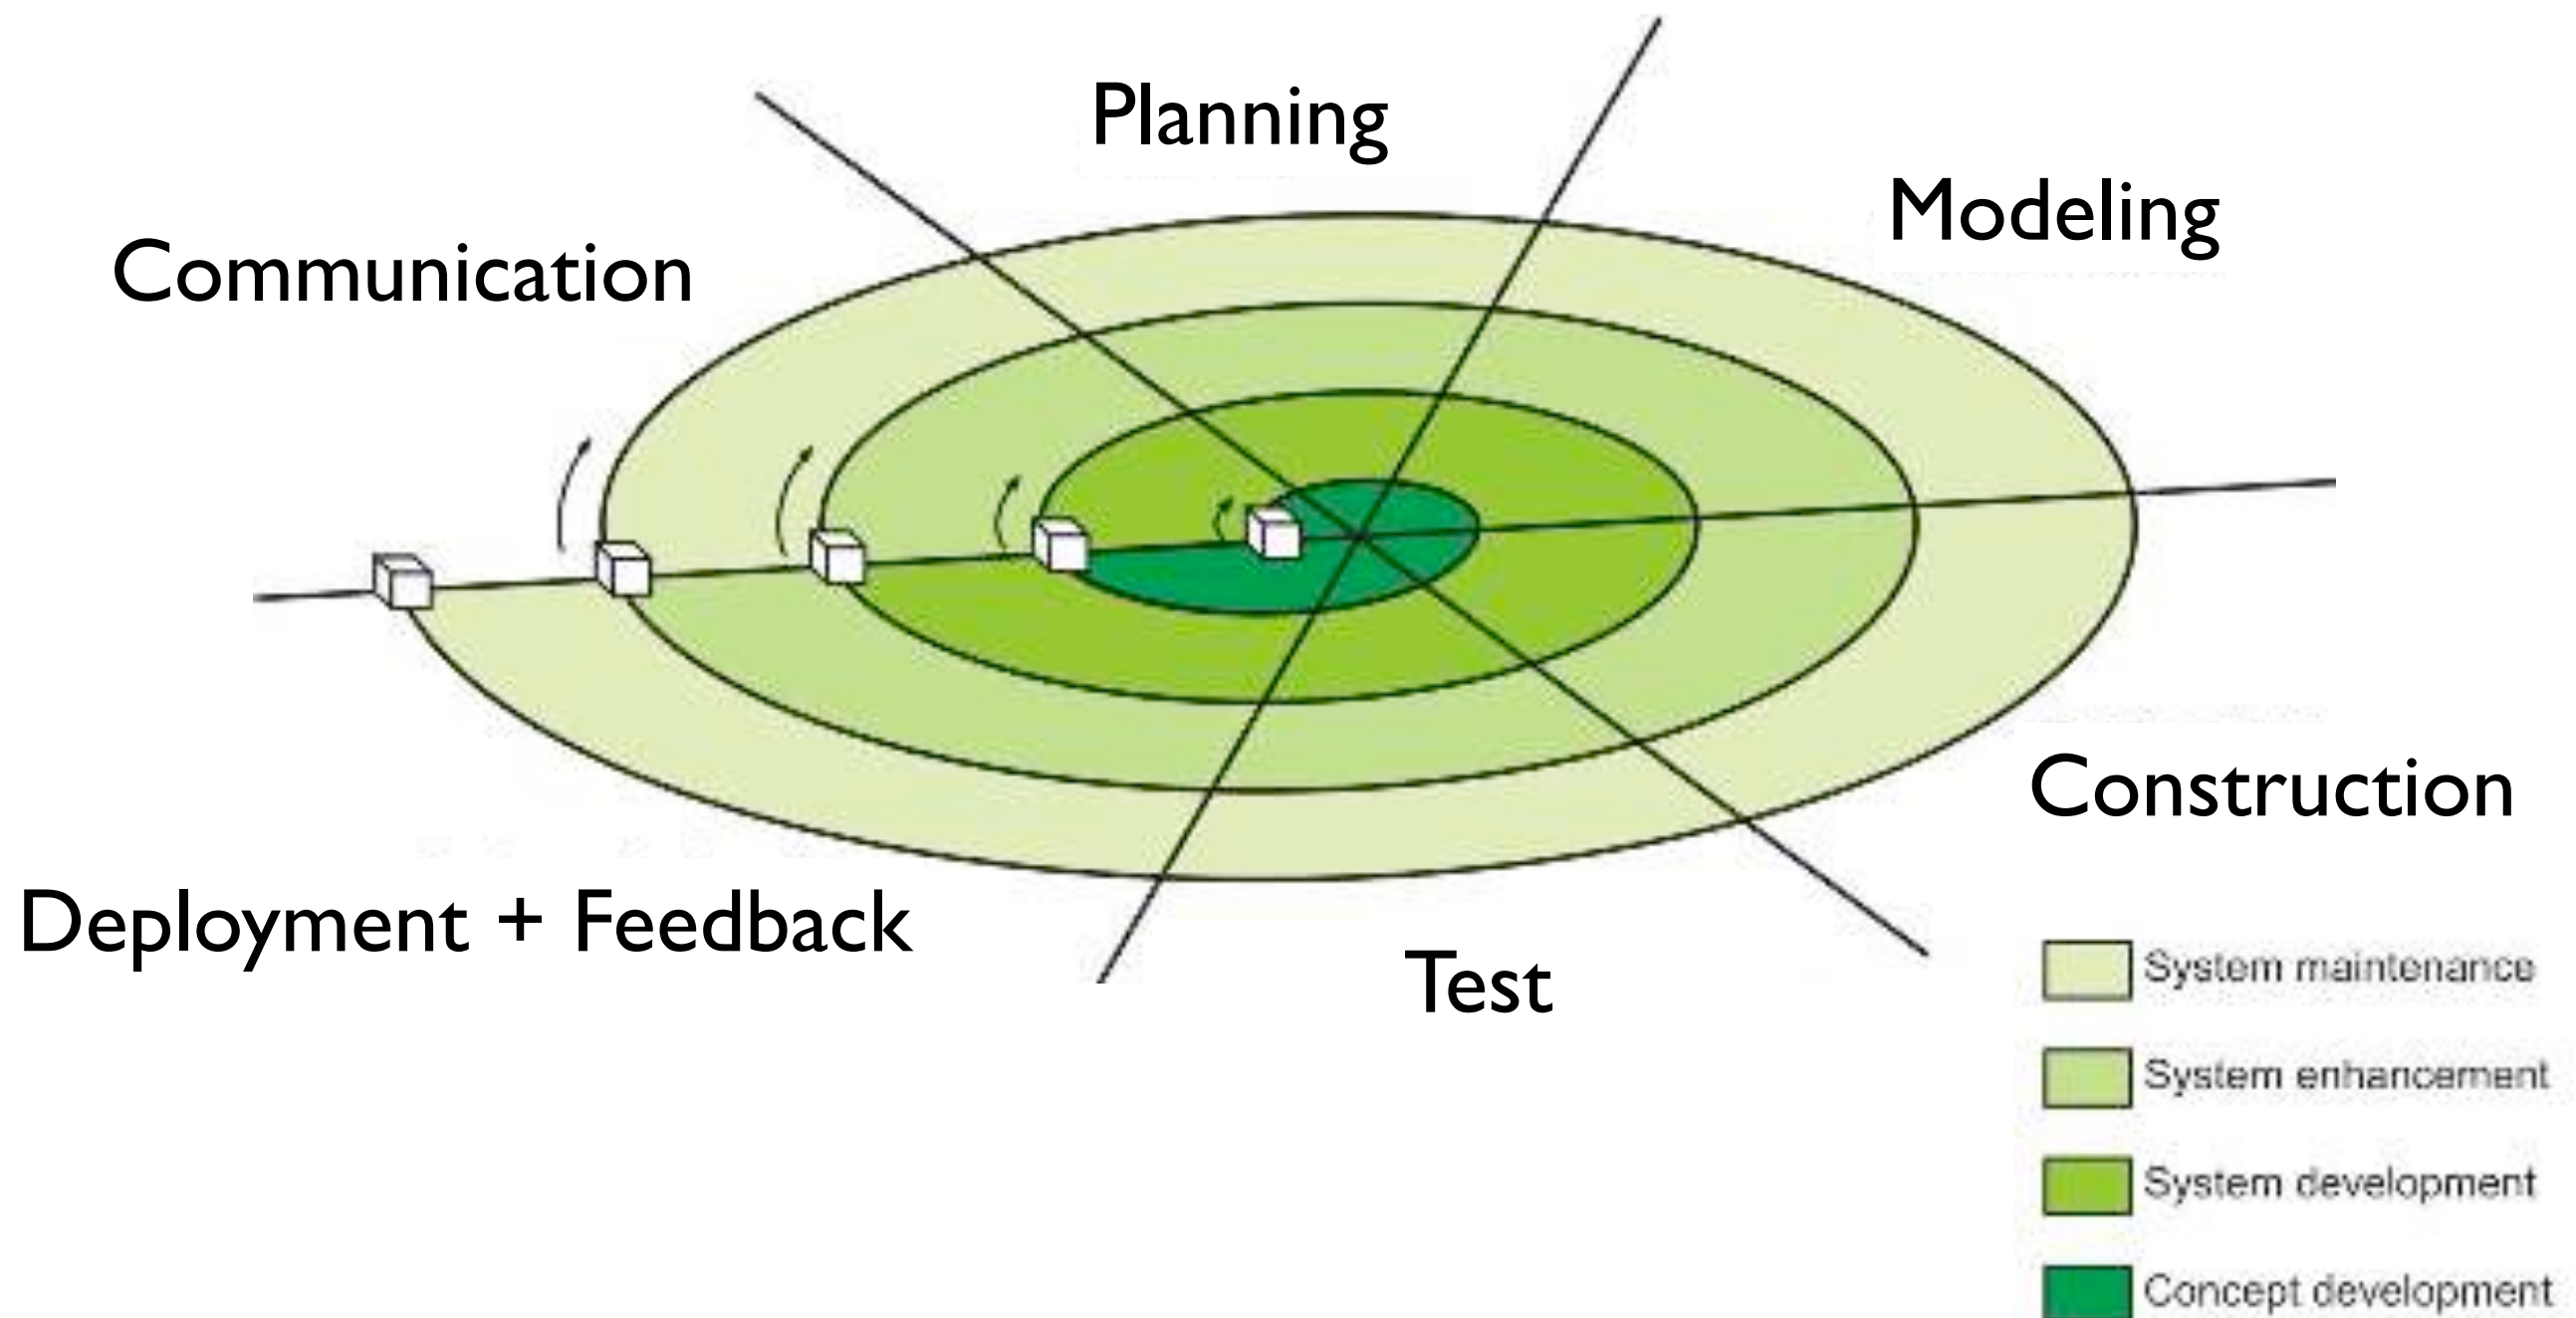

# Prototypes

- *A horizontal prototype* tests a particular layer (typically the GUI) of the system
- *A vertical prototype* tests a particular functionality across all layers
- Resist pressure to turn a prototype into a final result!

# Spiral Model

(1988)

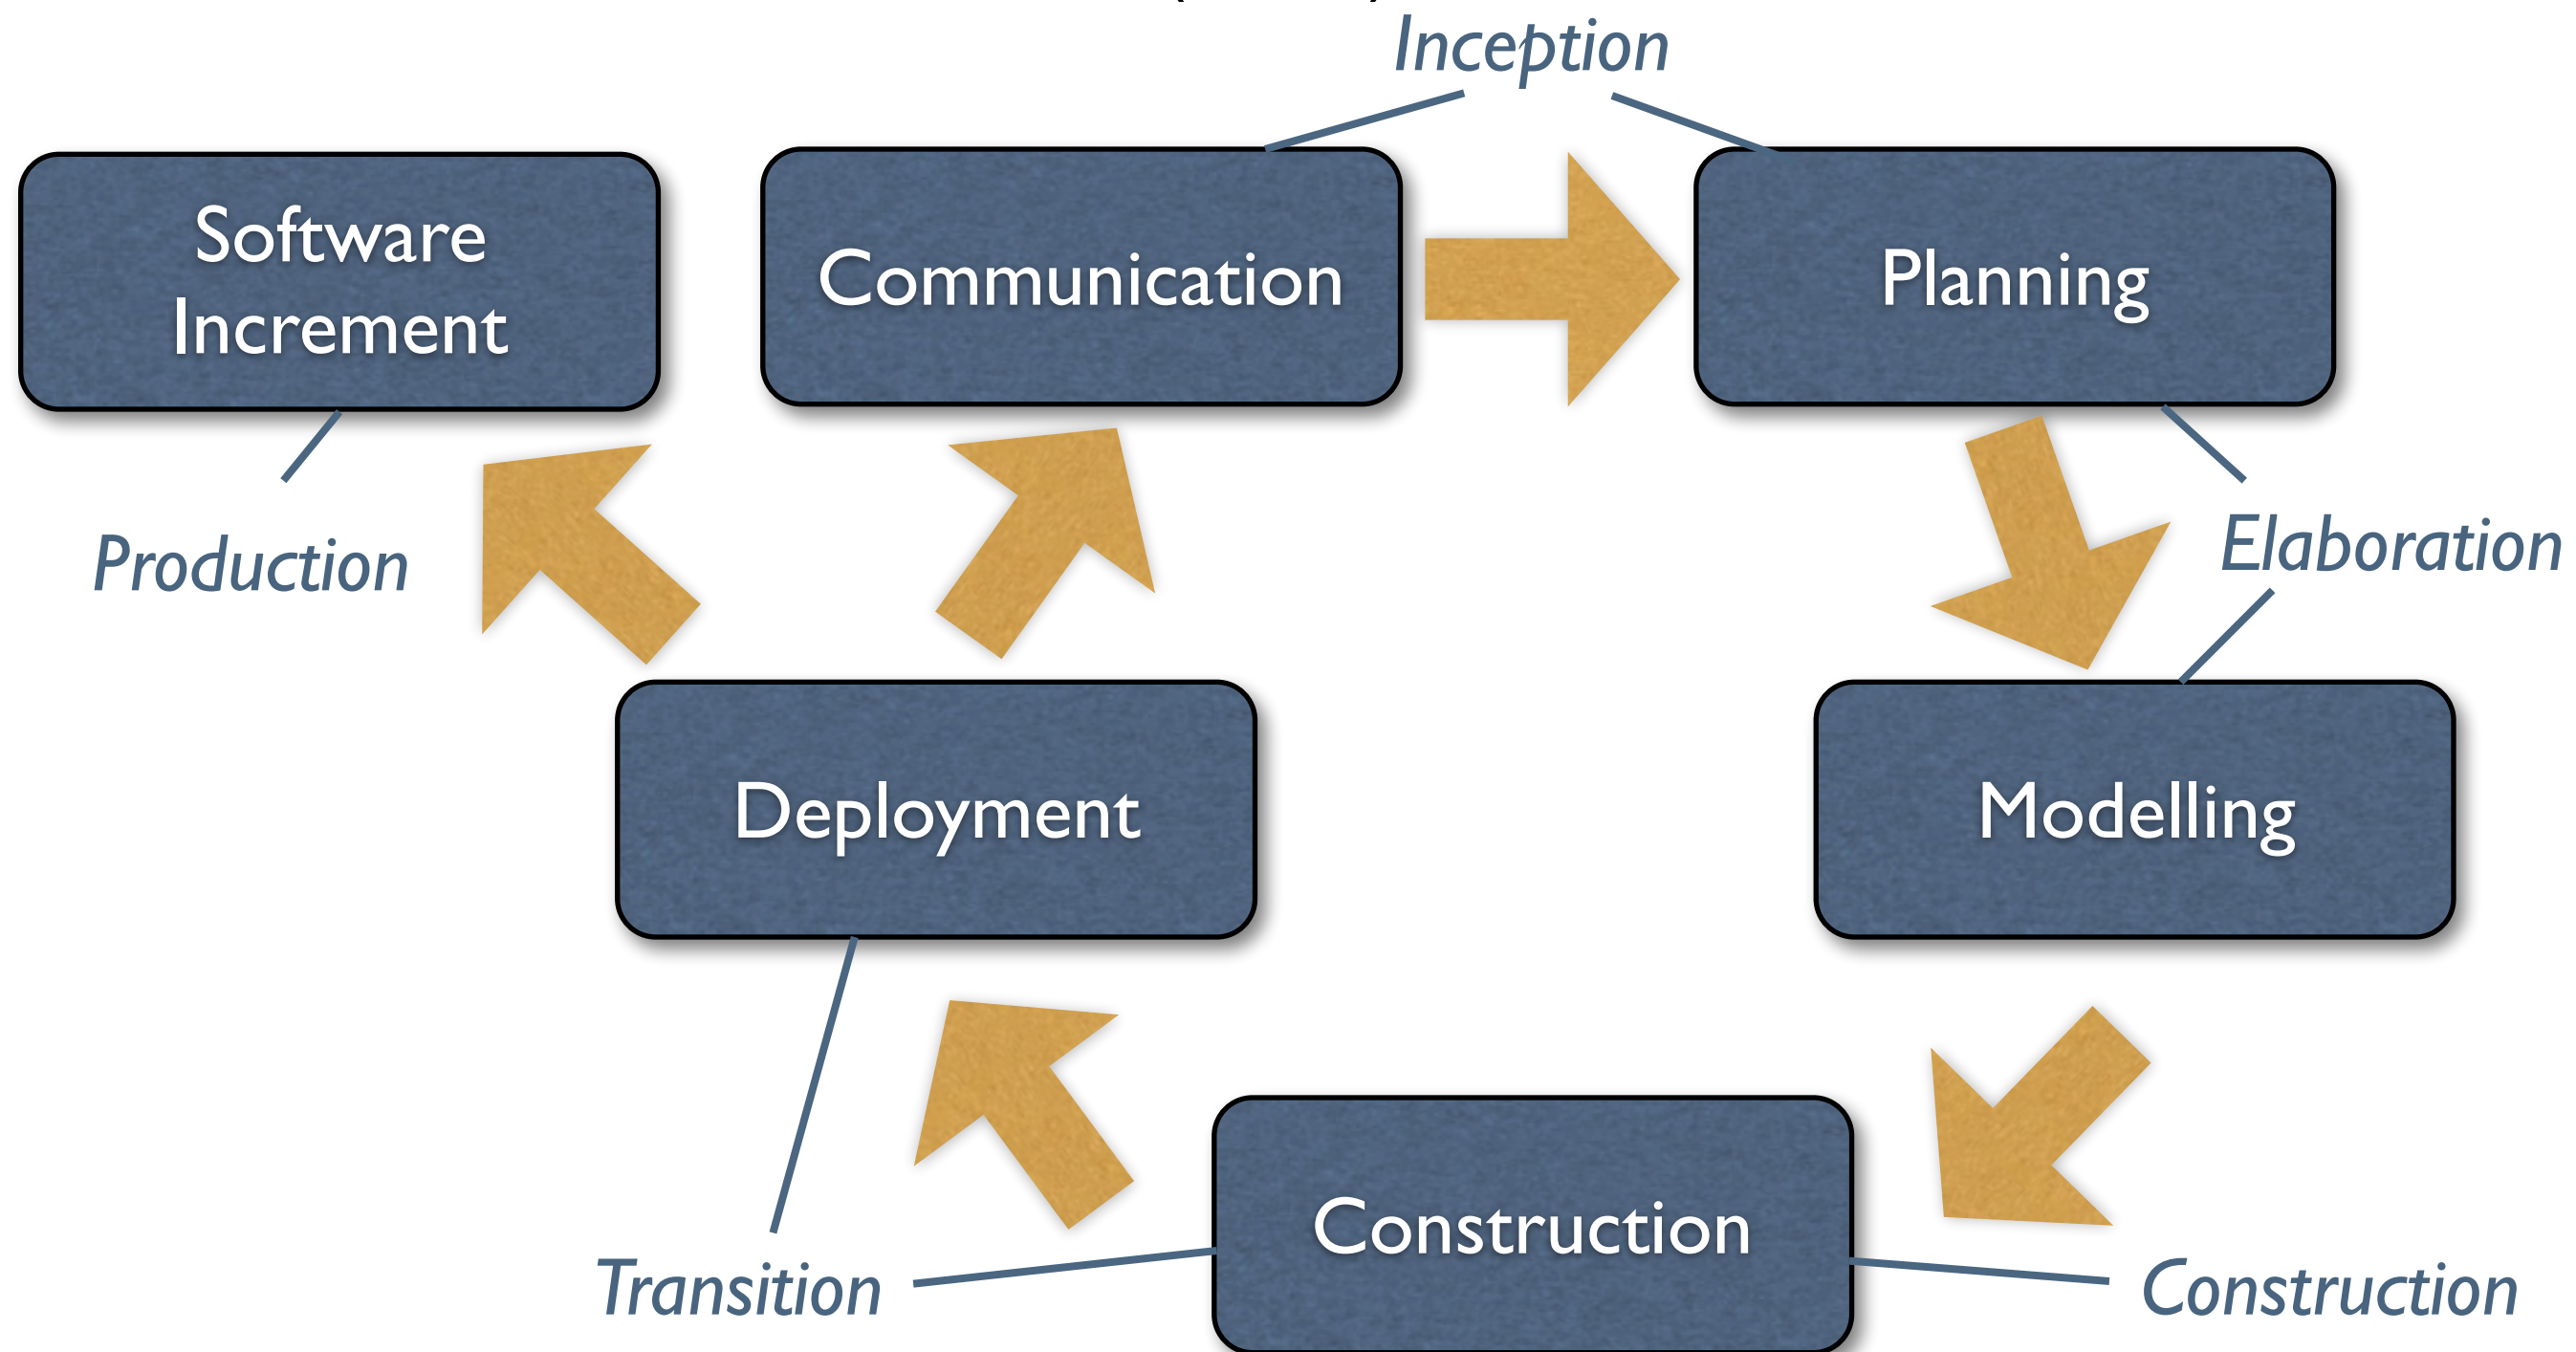

# Spiral Model

- System is developed in series of evolutionary releases
- Milestones for each iteration of the spiral
- Process does not end with delivery
- Reflects iterative nature of development

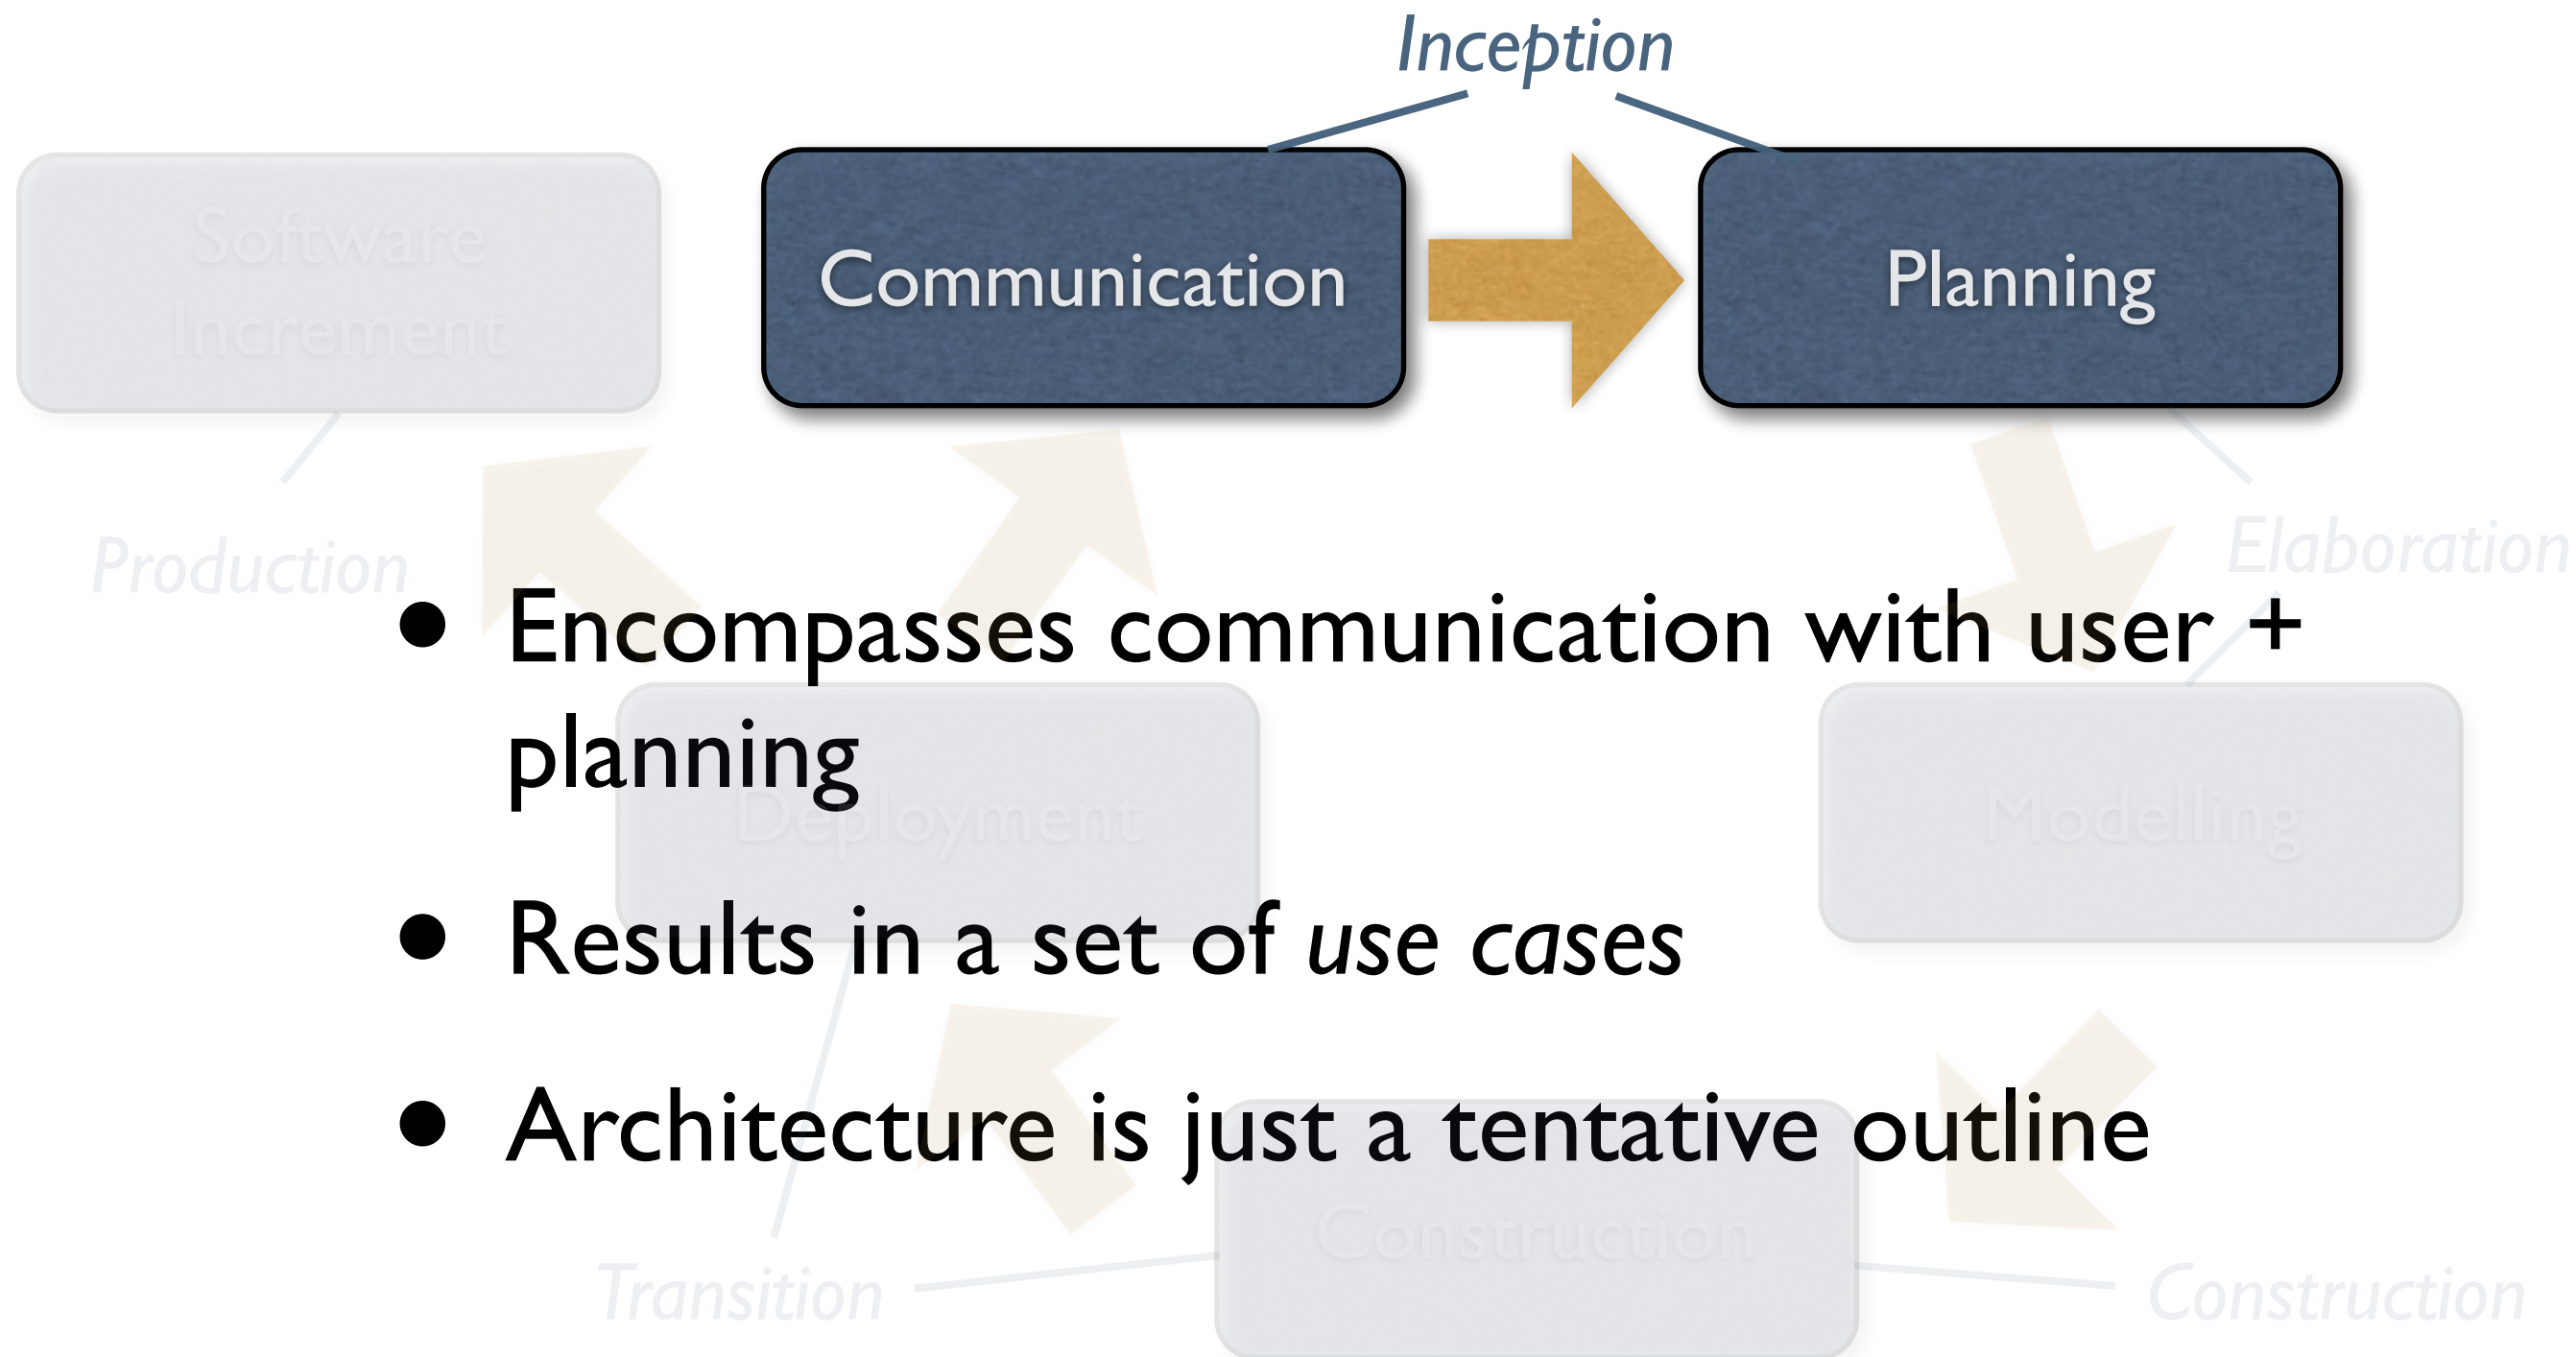

# Unified Process

(1999)

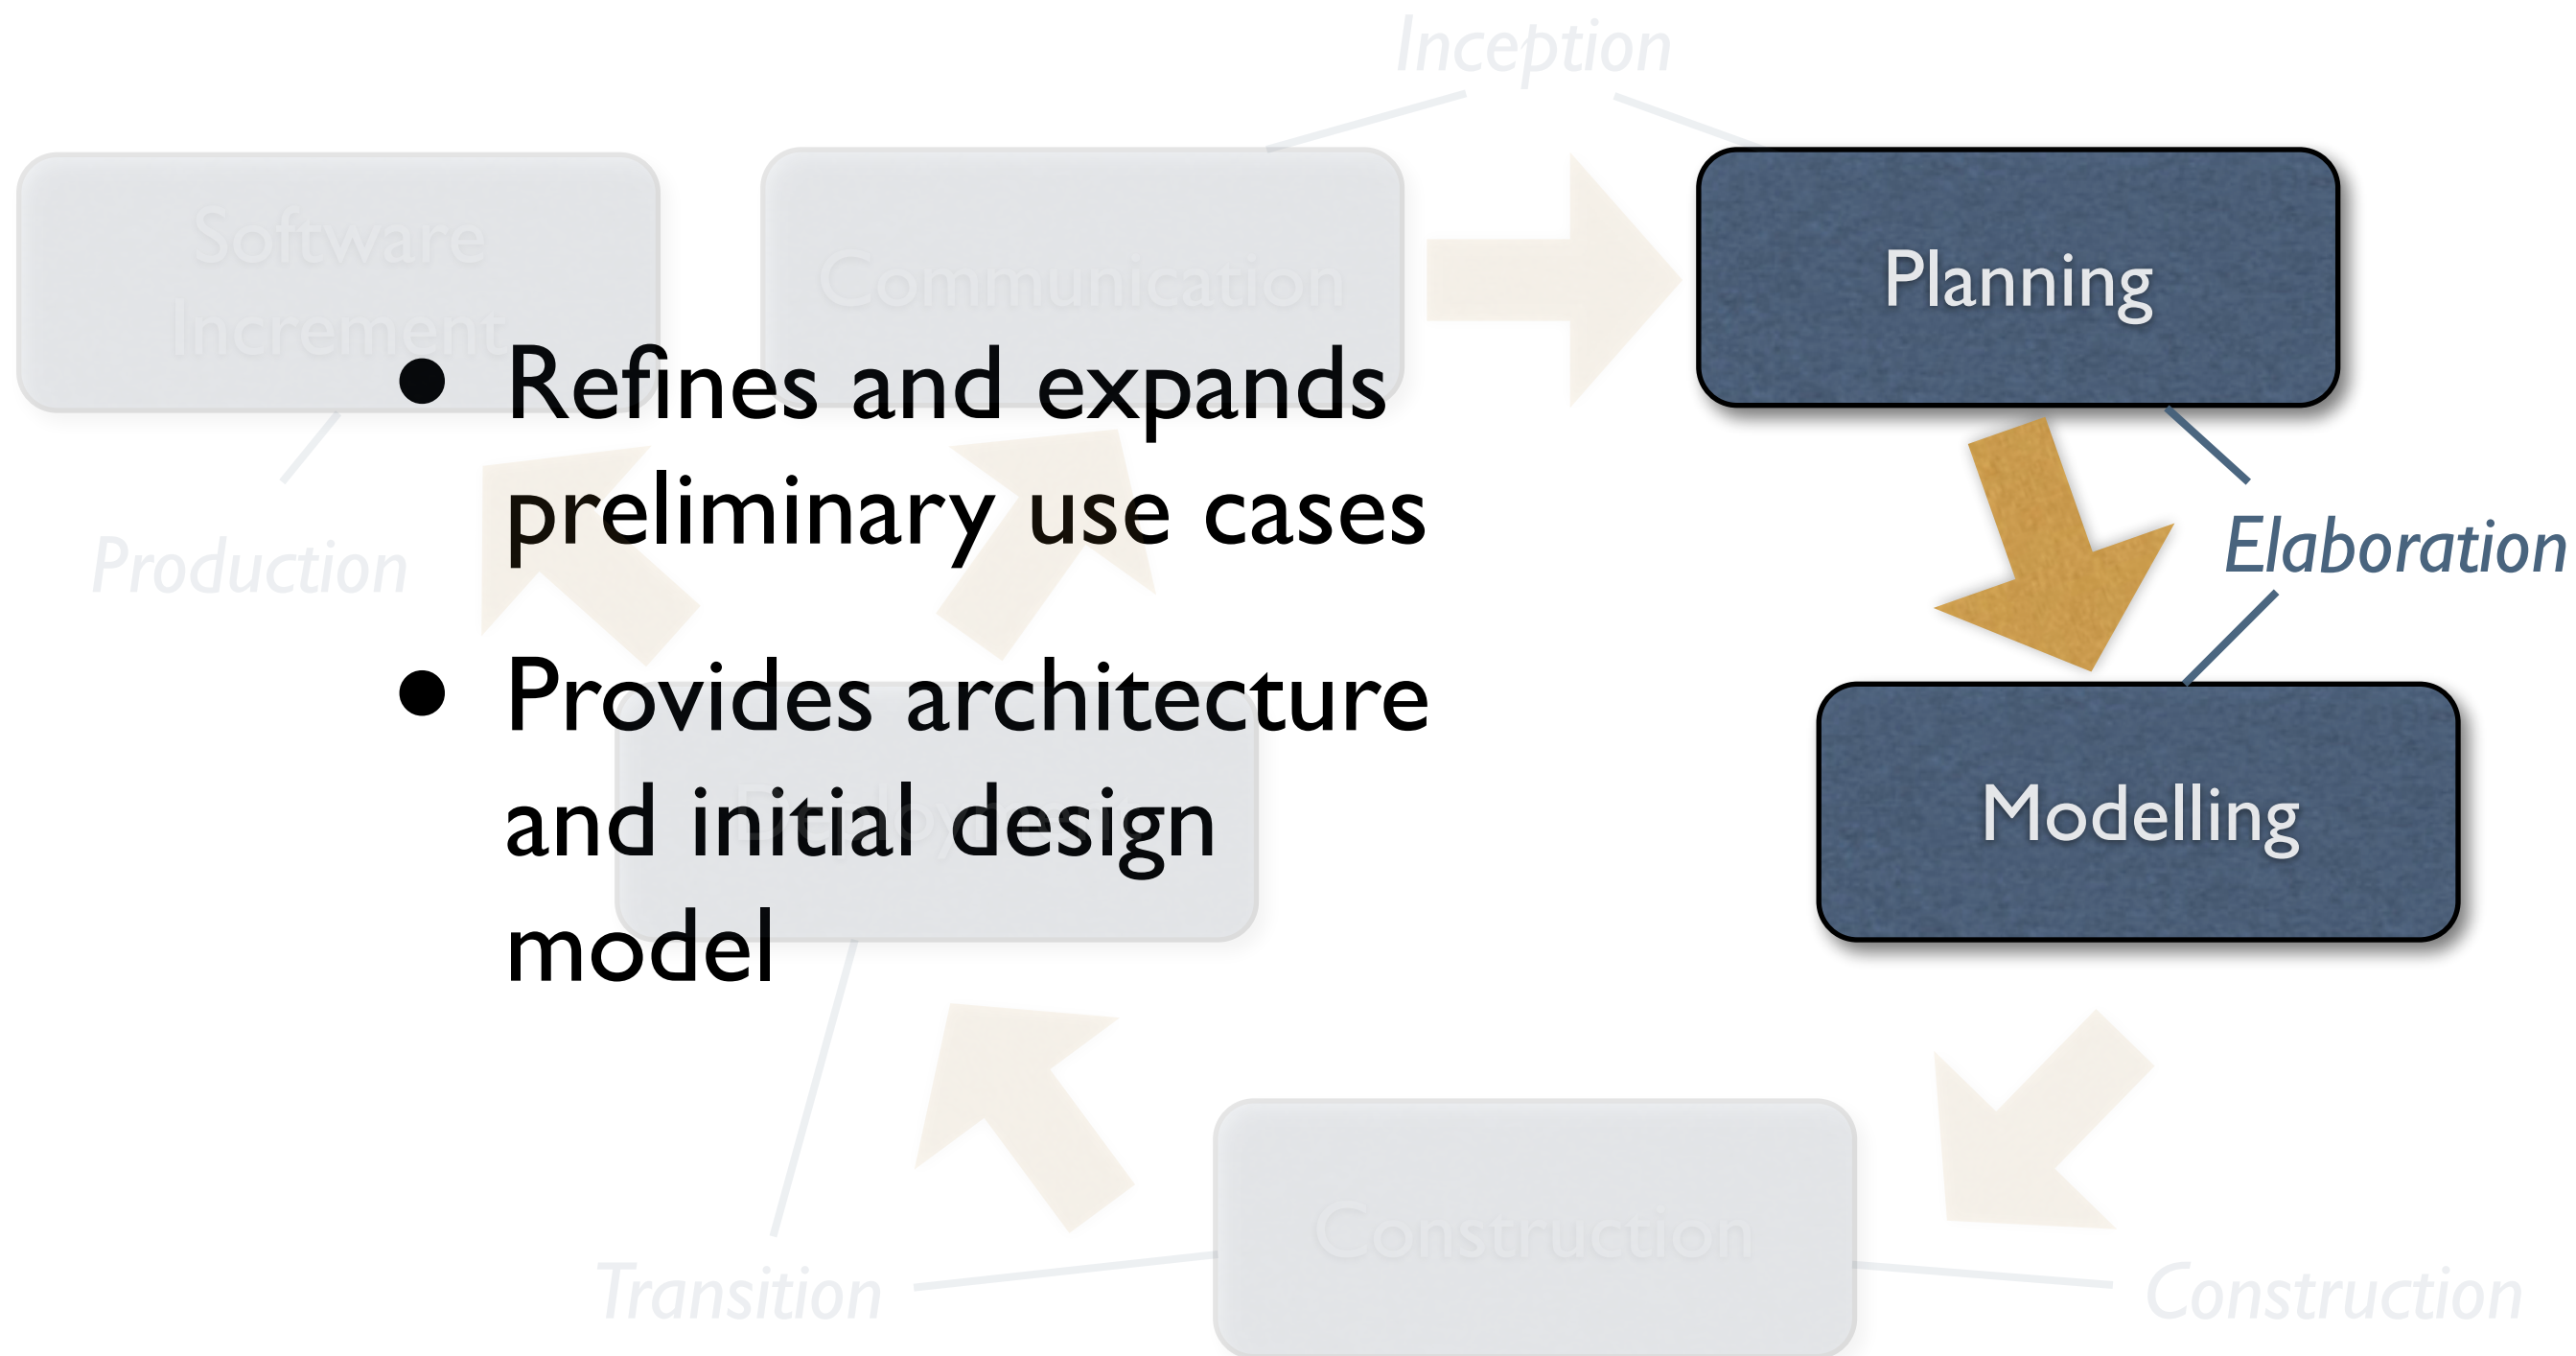

# Inception

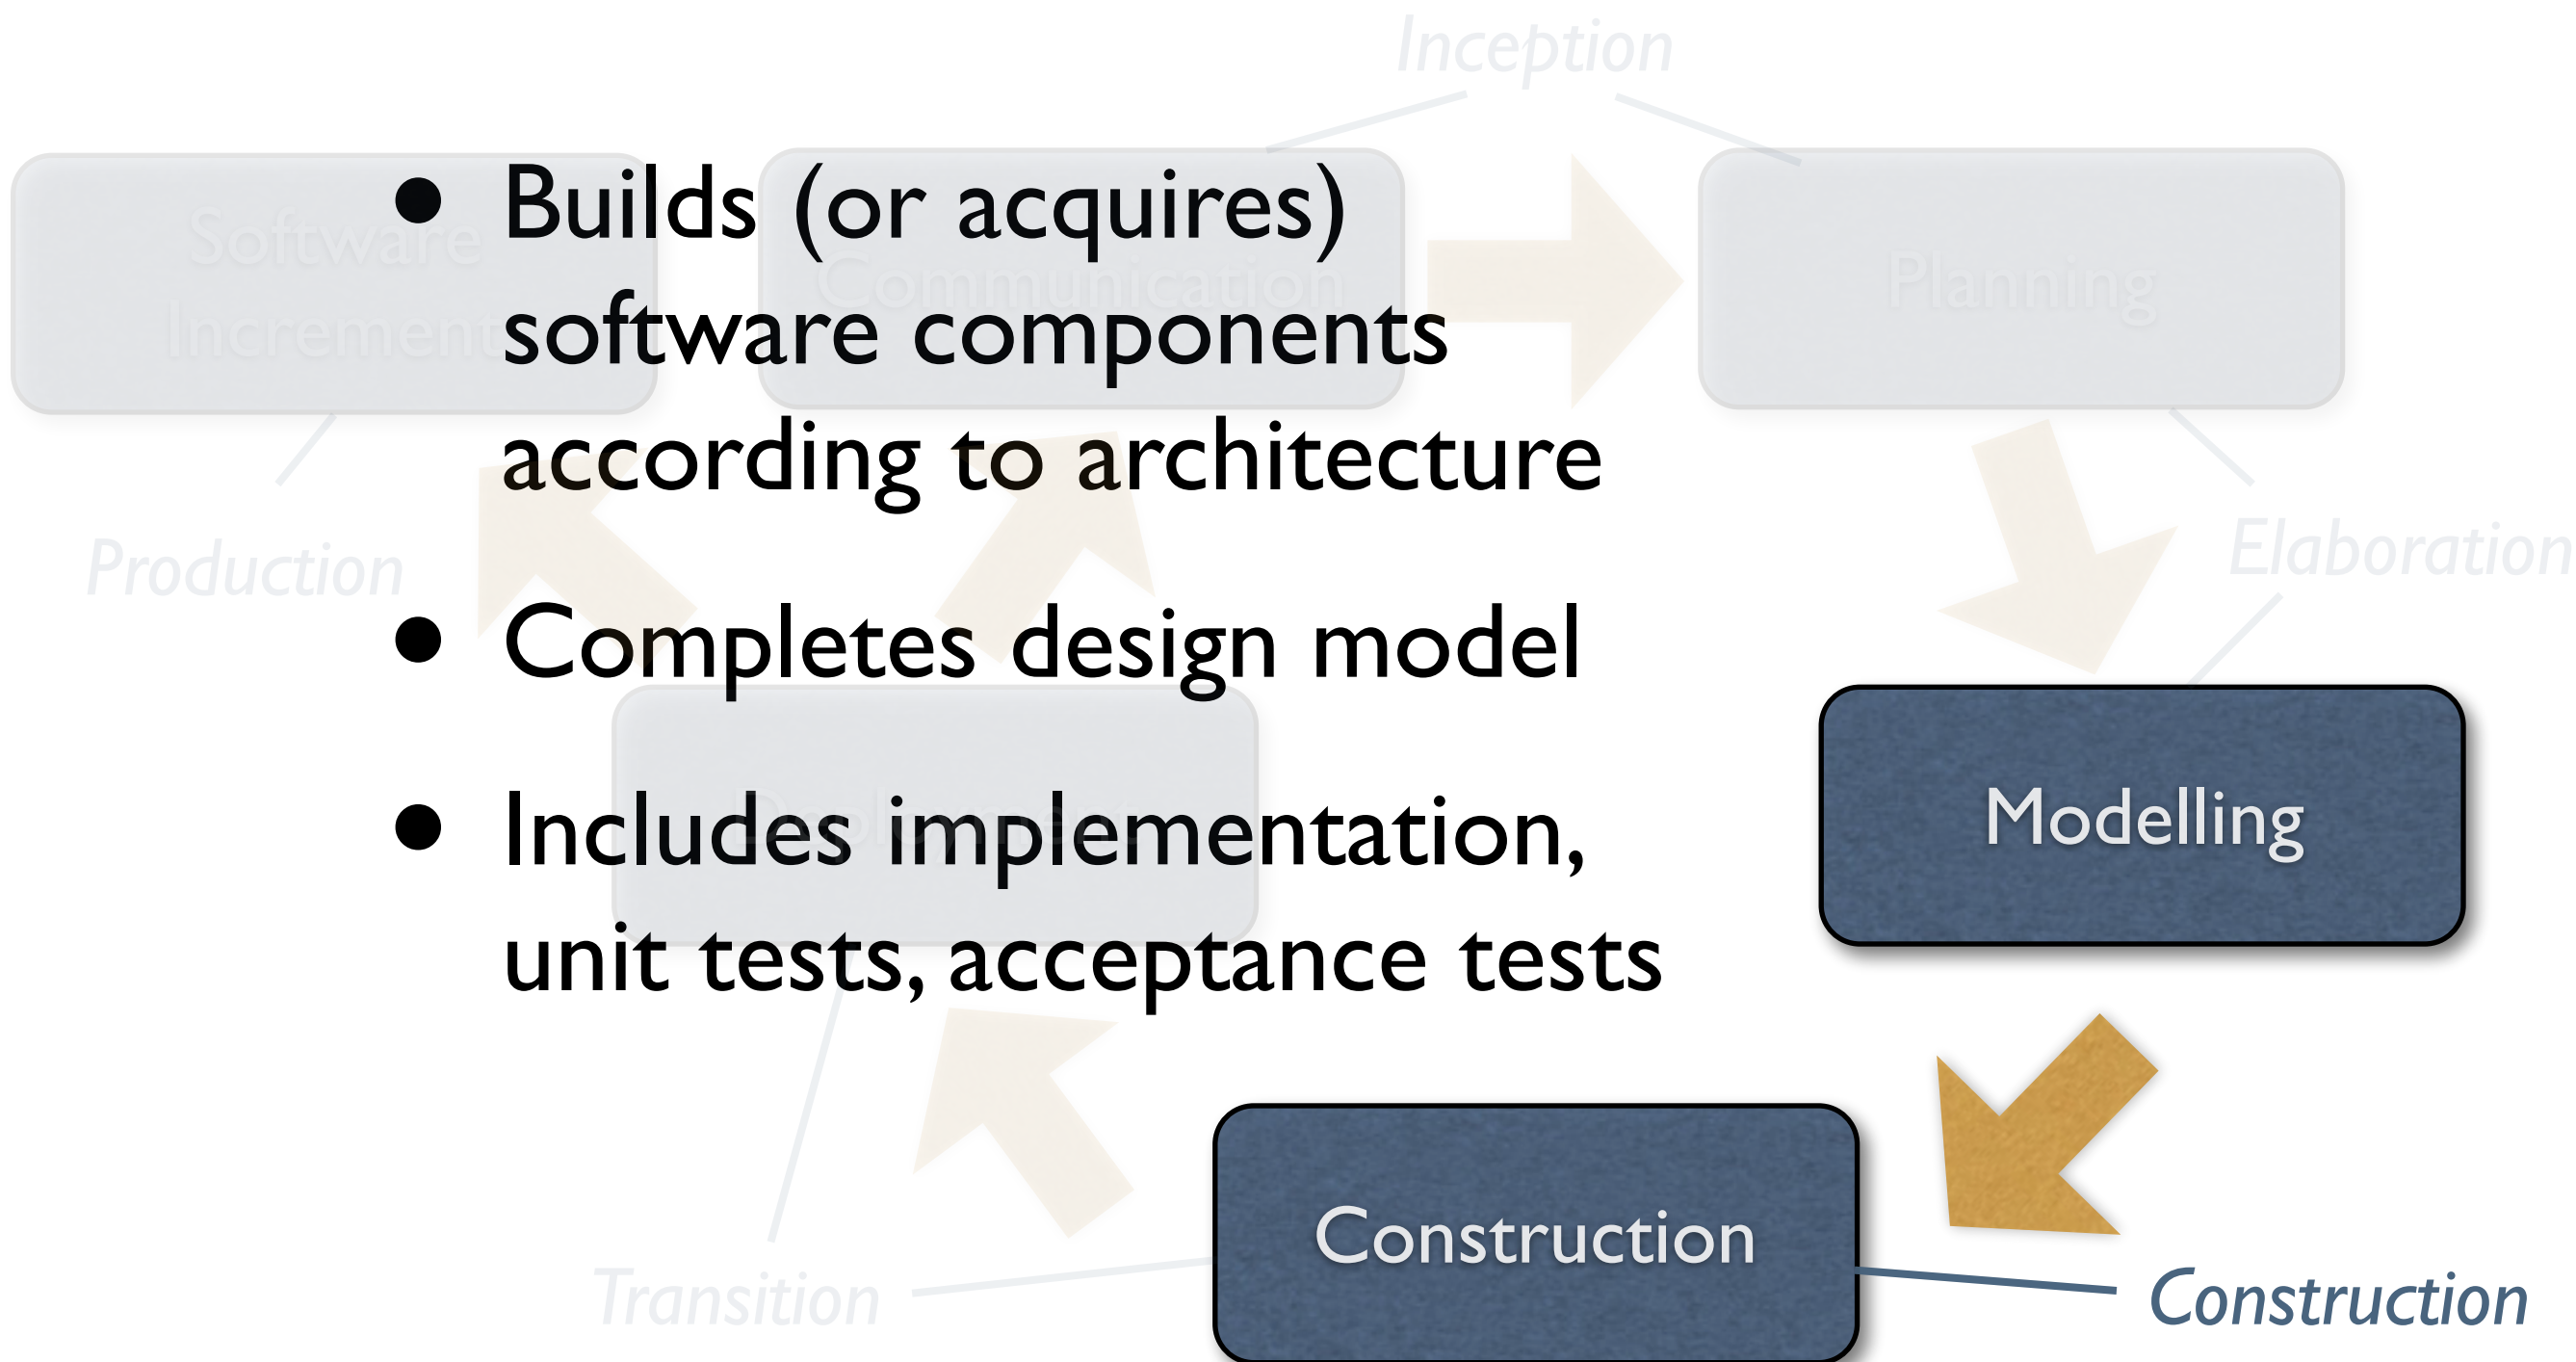

# Elaboration

- Refines and expands preliminary use cases
- Provides architecture and initial design model

# Construction

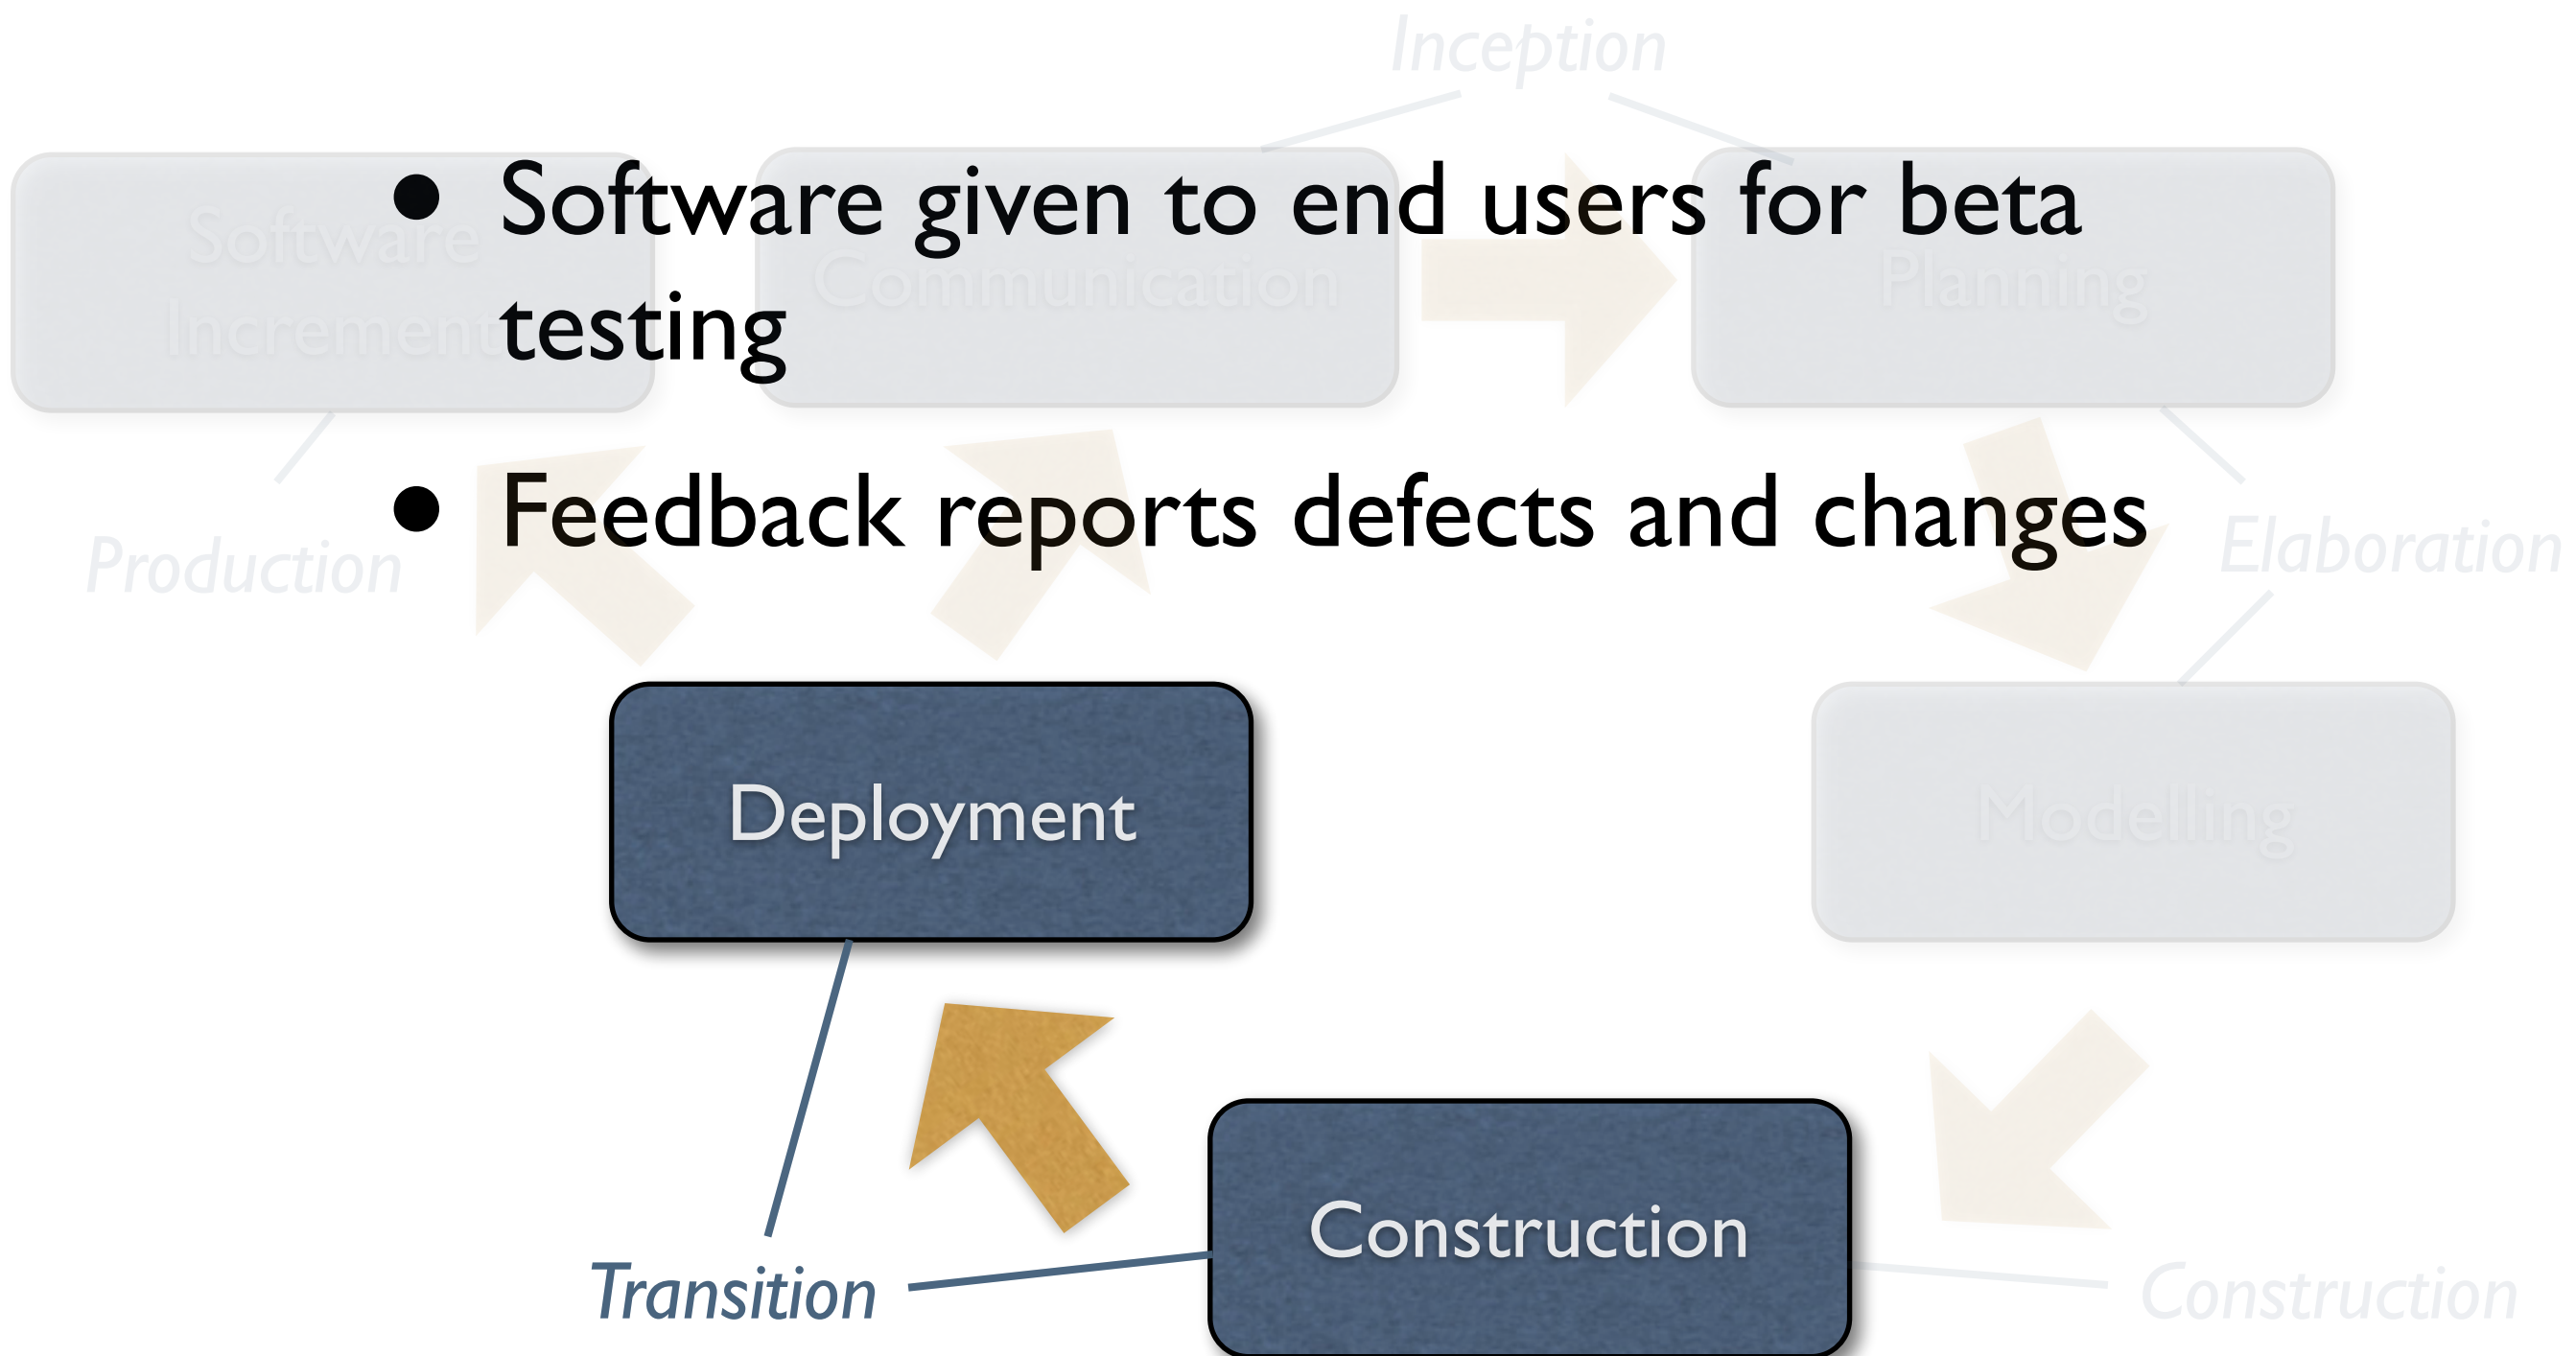

- Builds (or acquires) software components according to architecture
- Completes design model
- Includes implementation, unit tests, acceptance tests

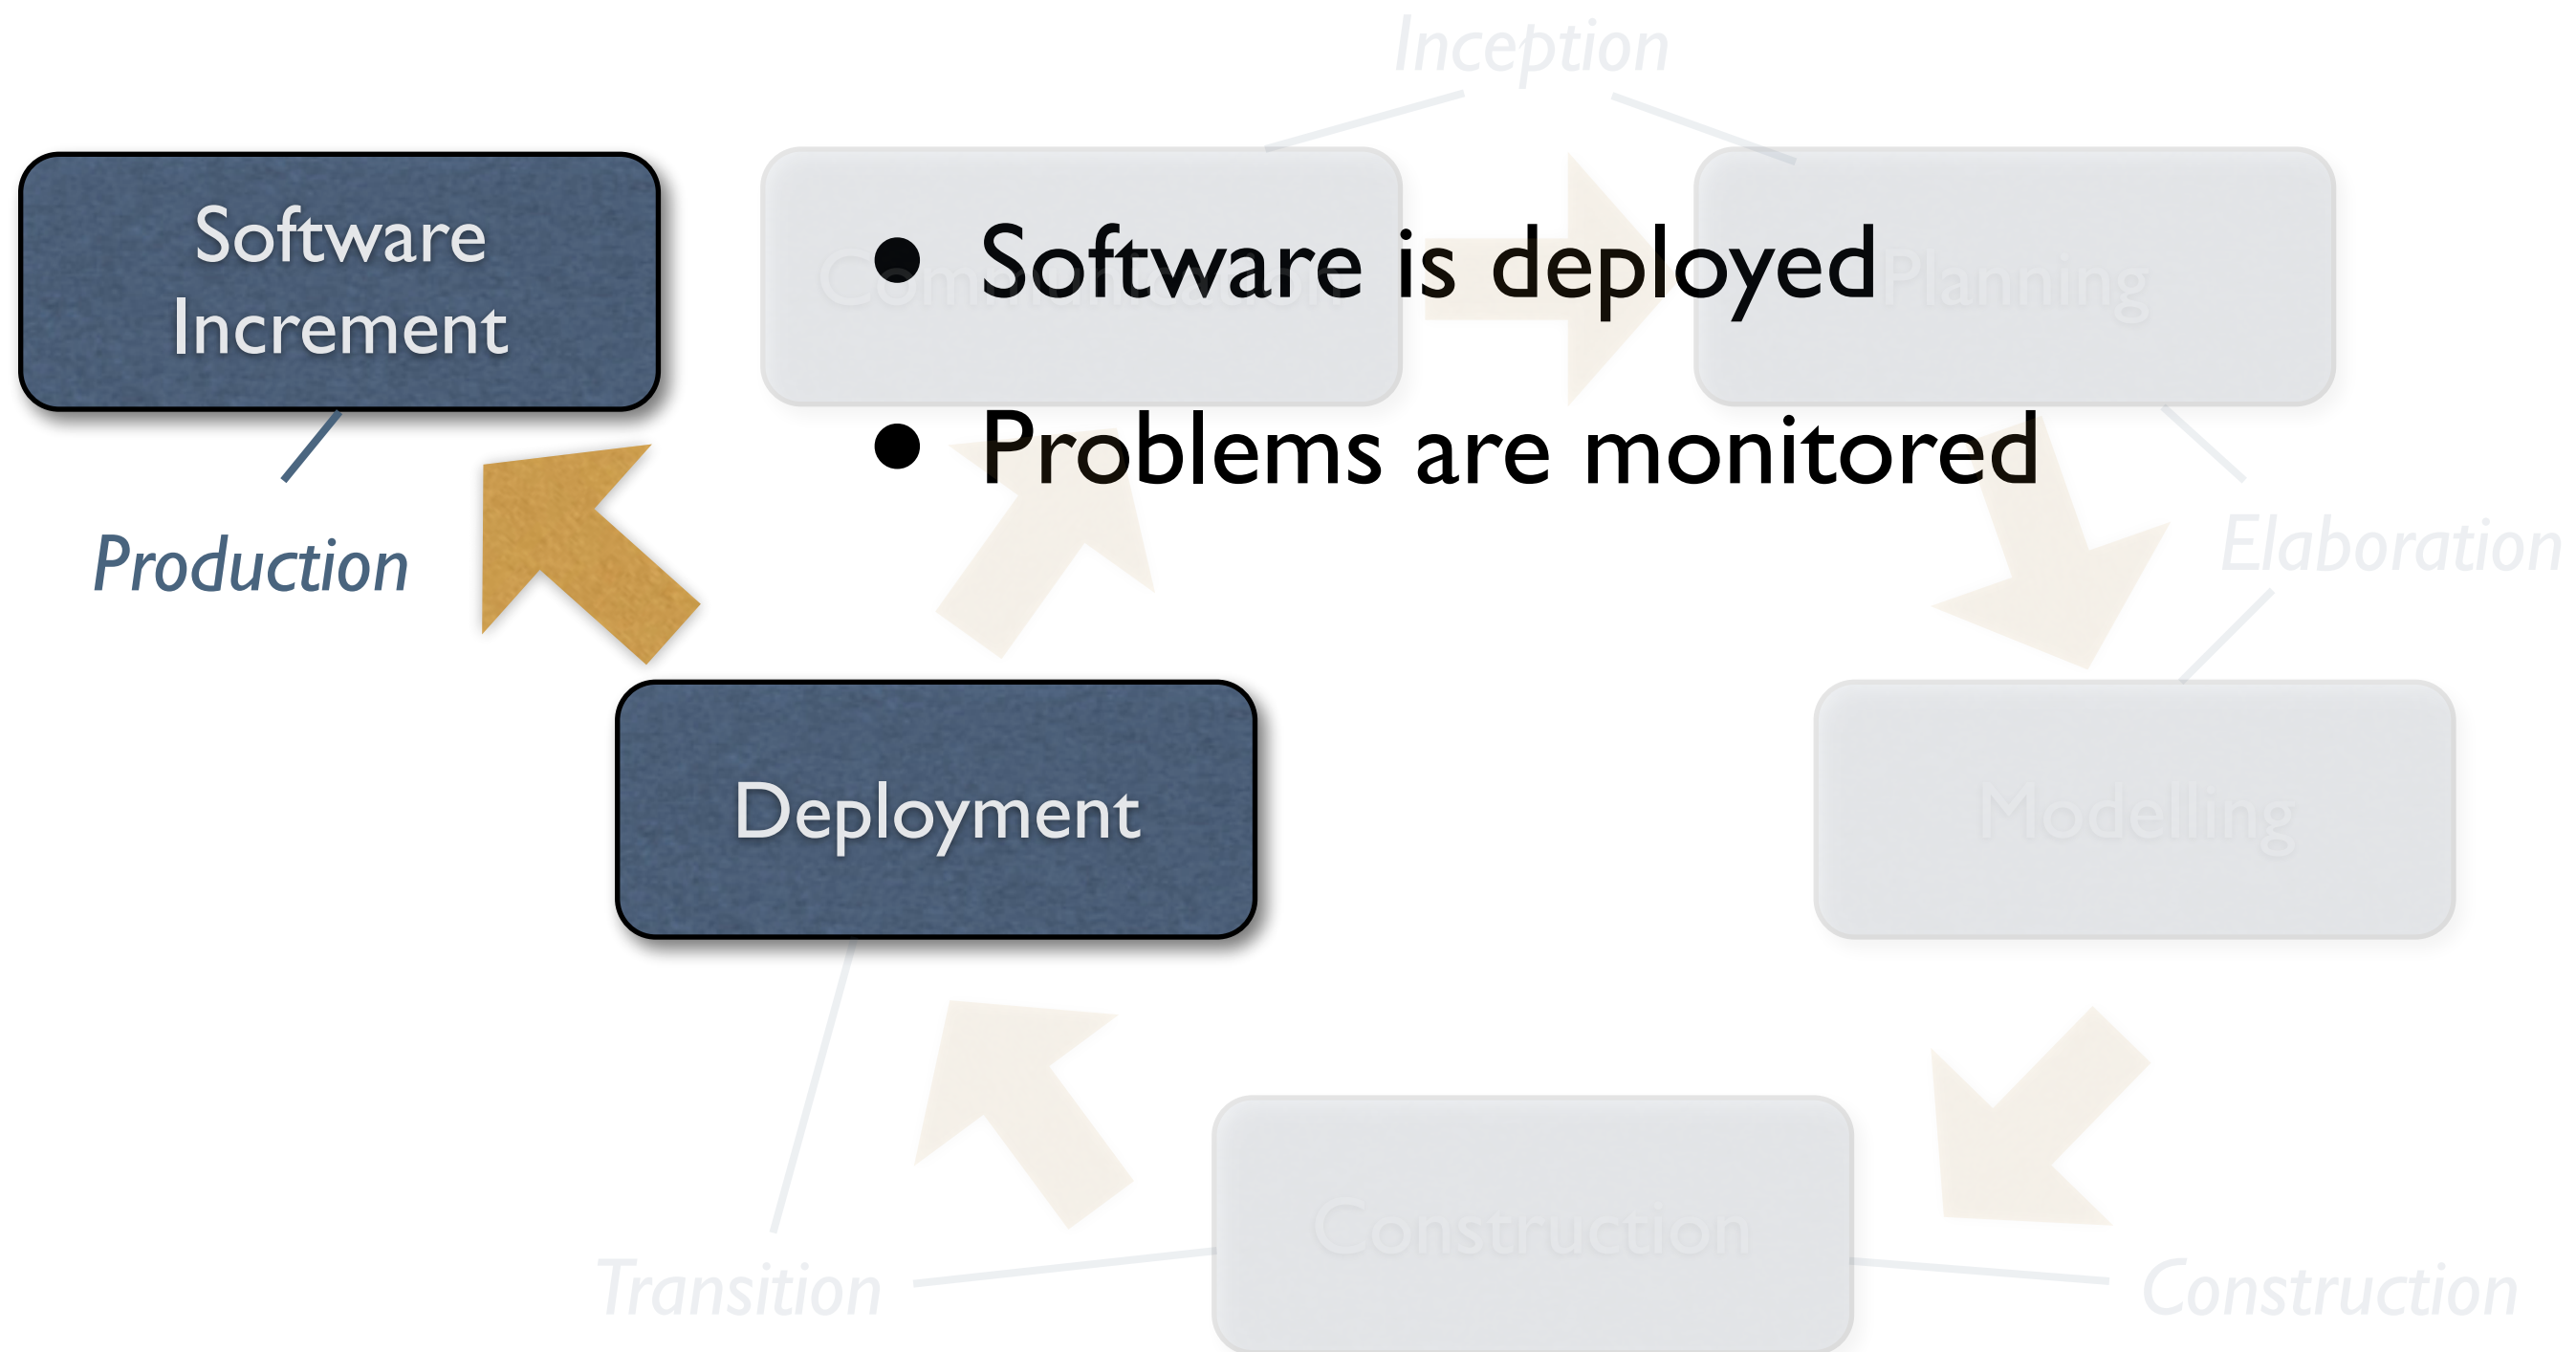

# Transition

- Software given to end users for beta testing
- Feedback reports defects and changes

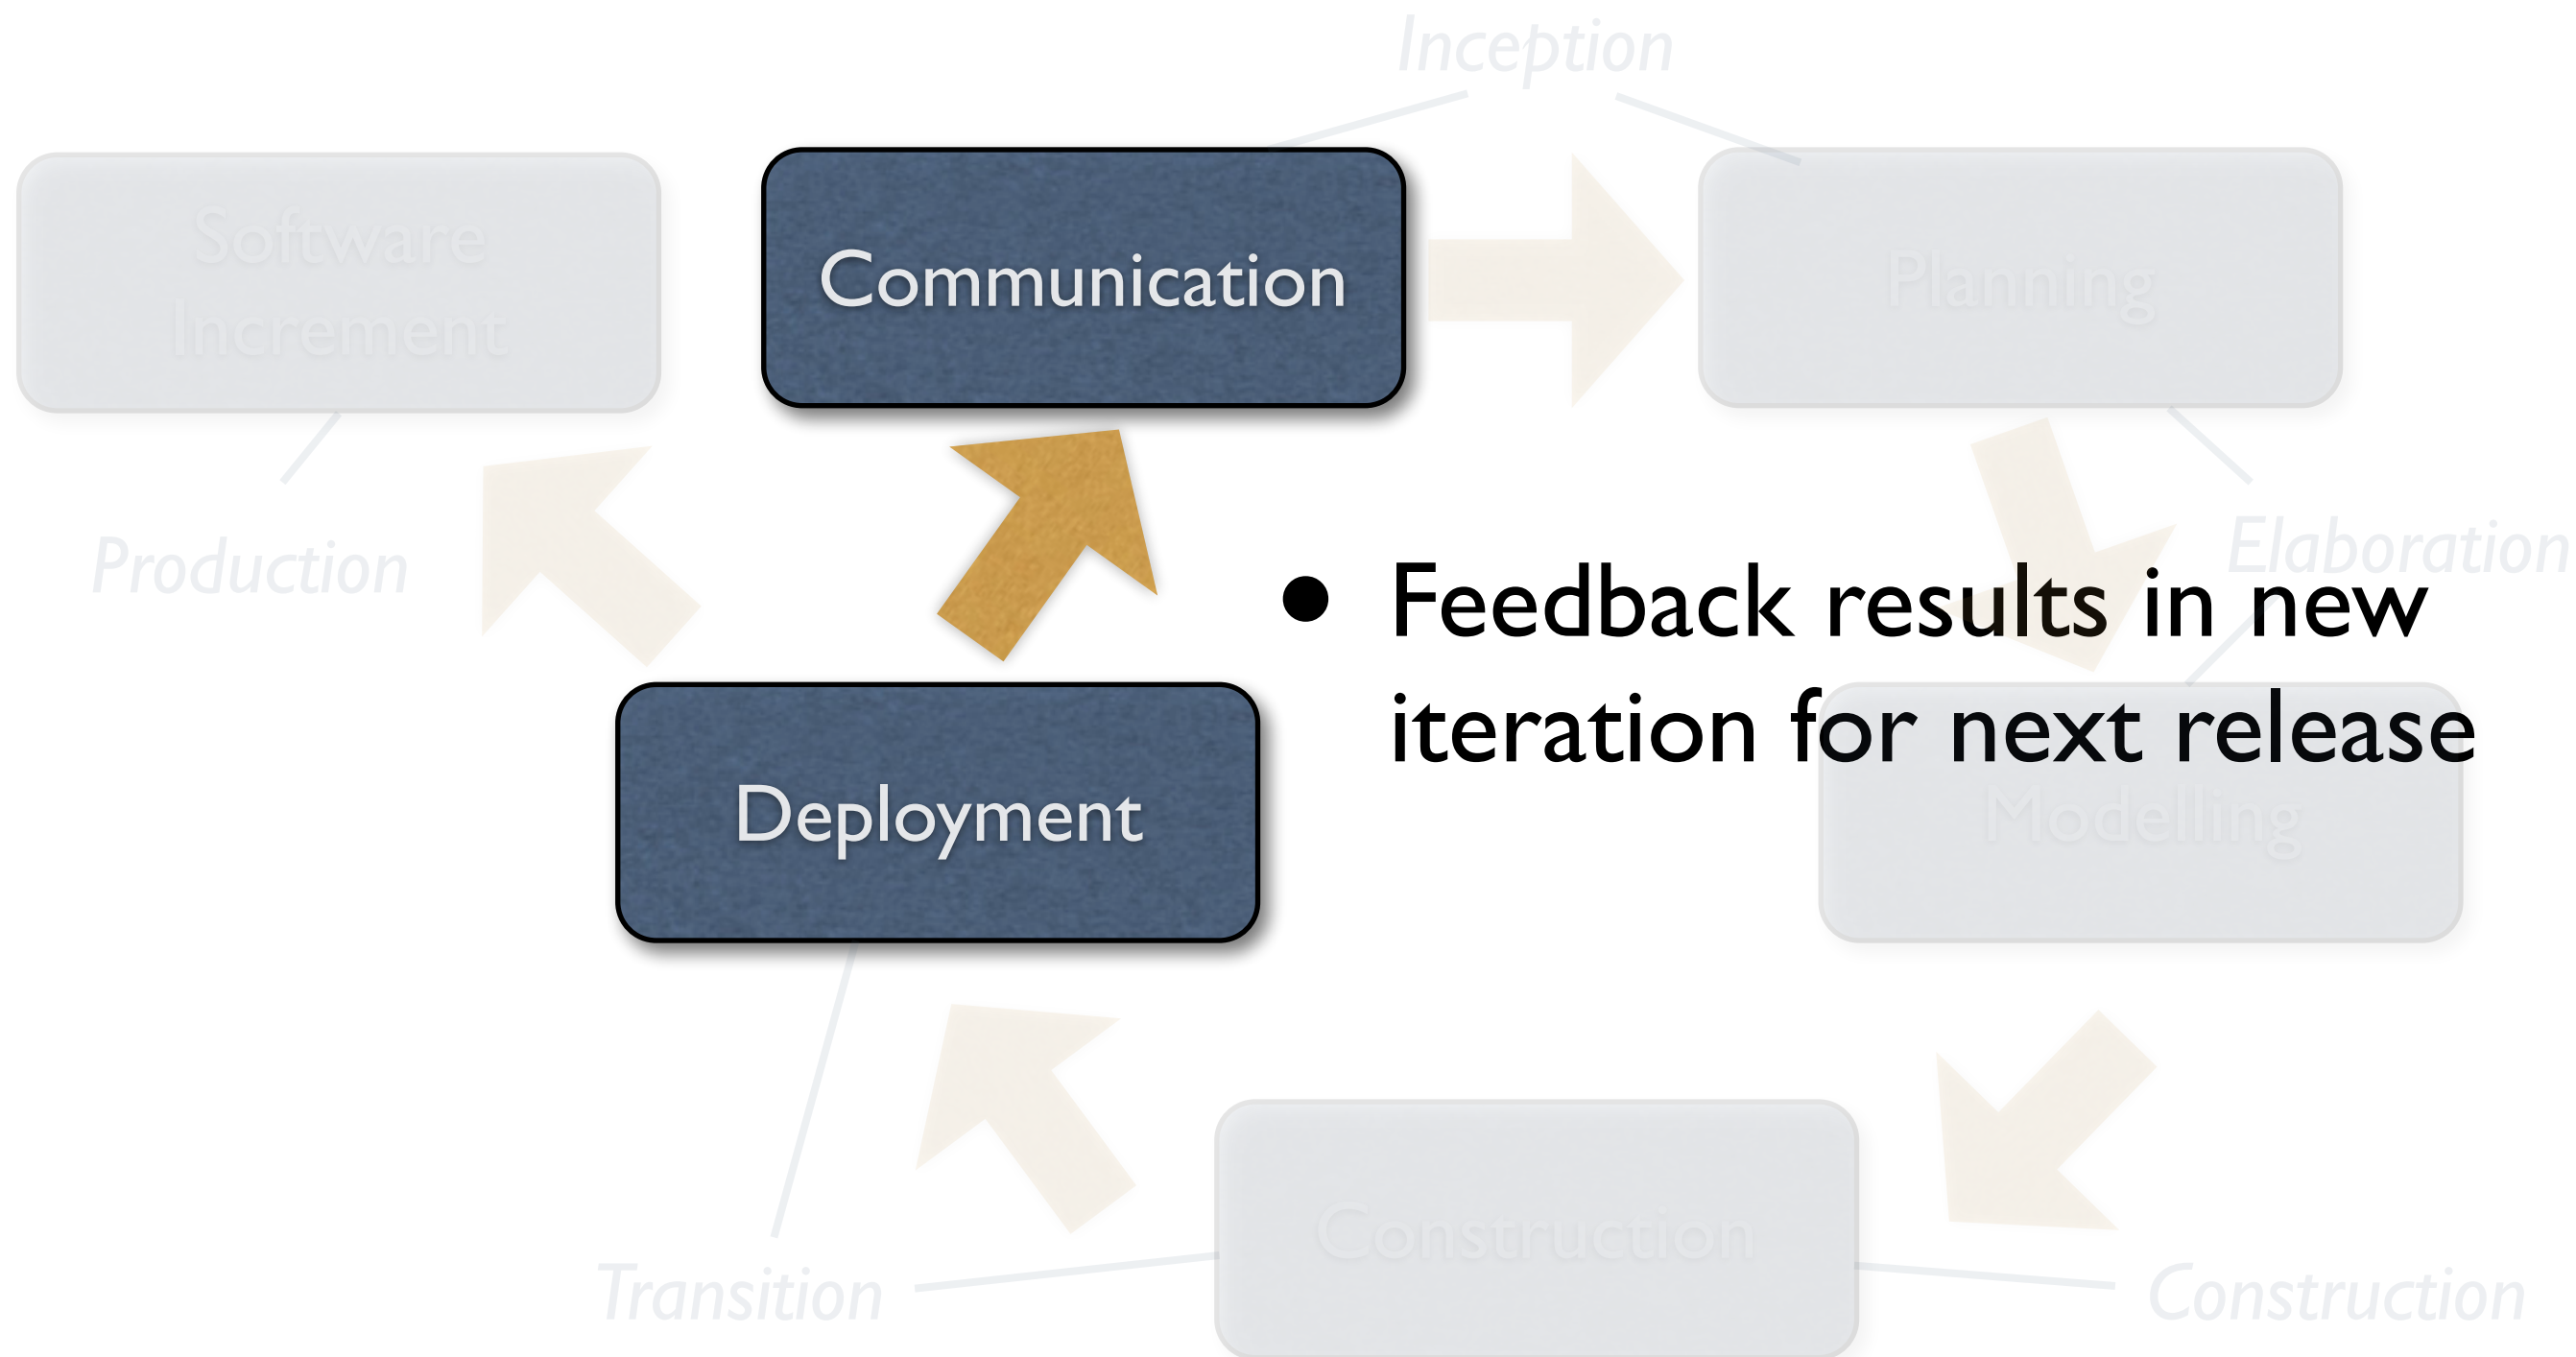

# Production

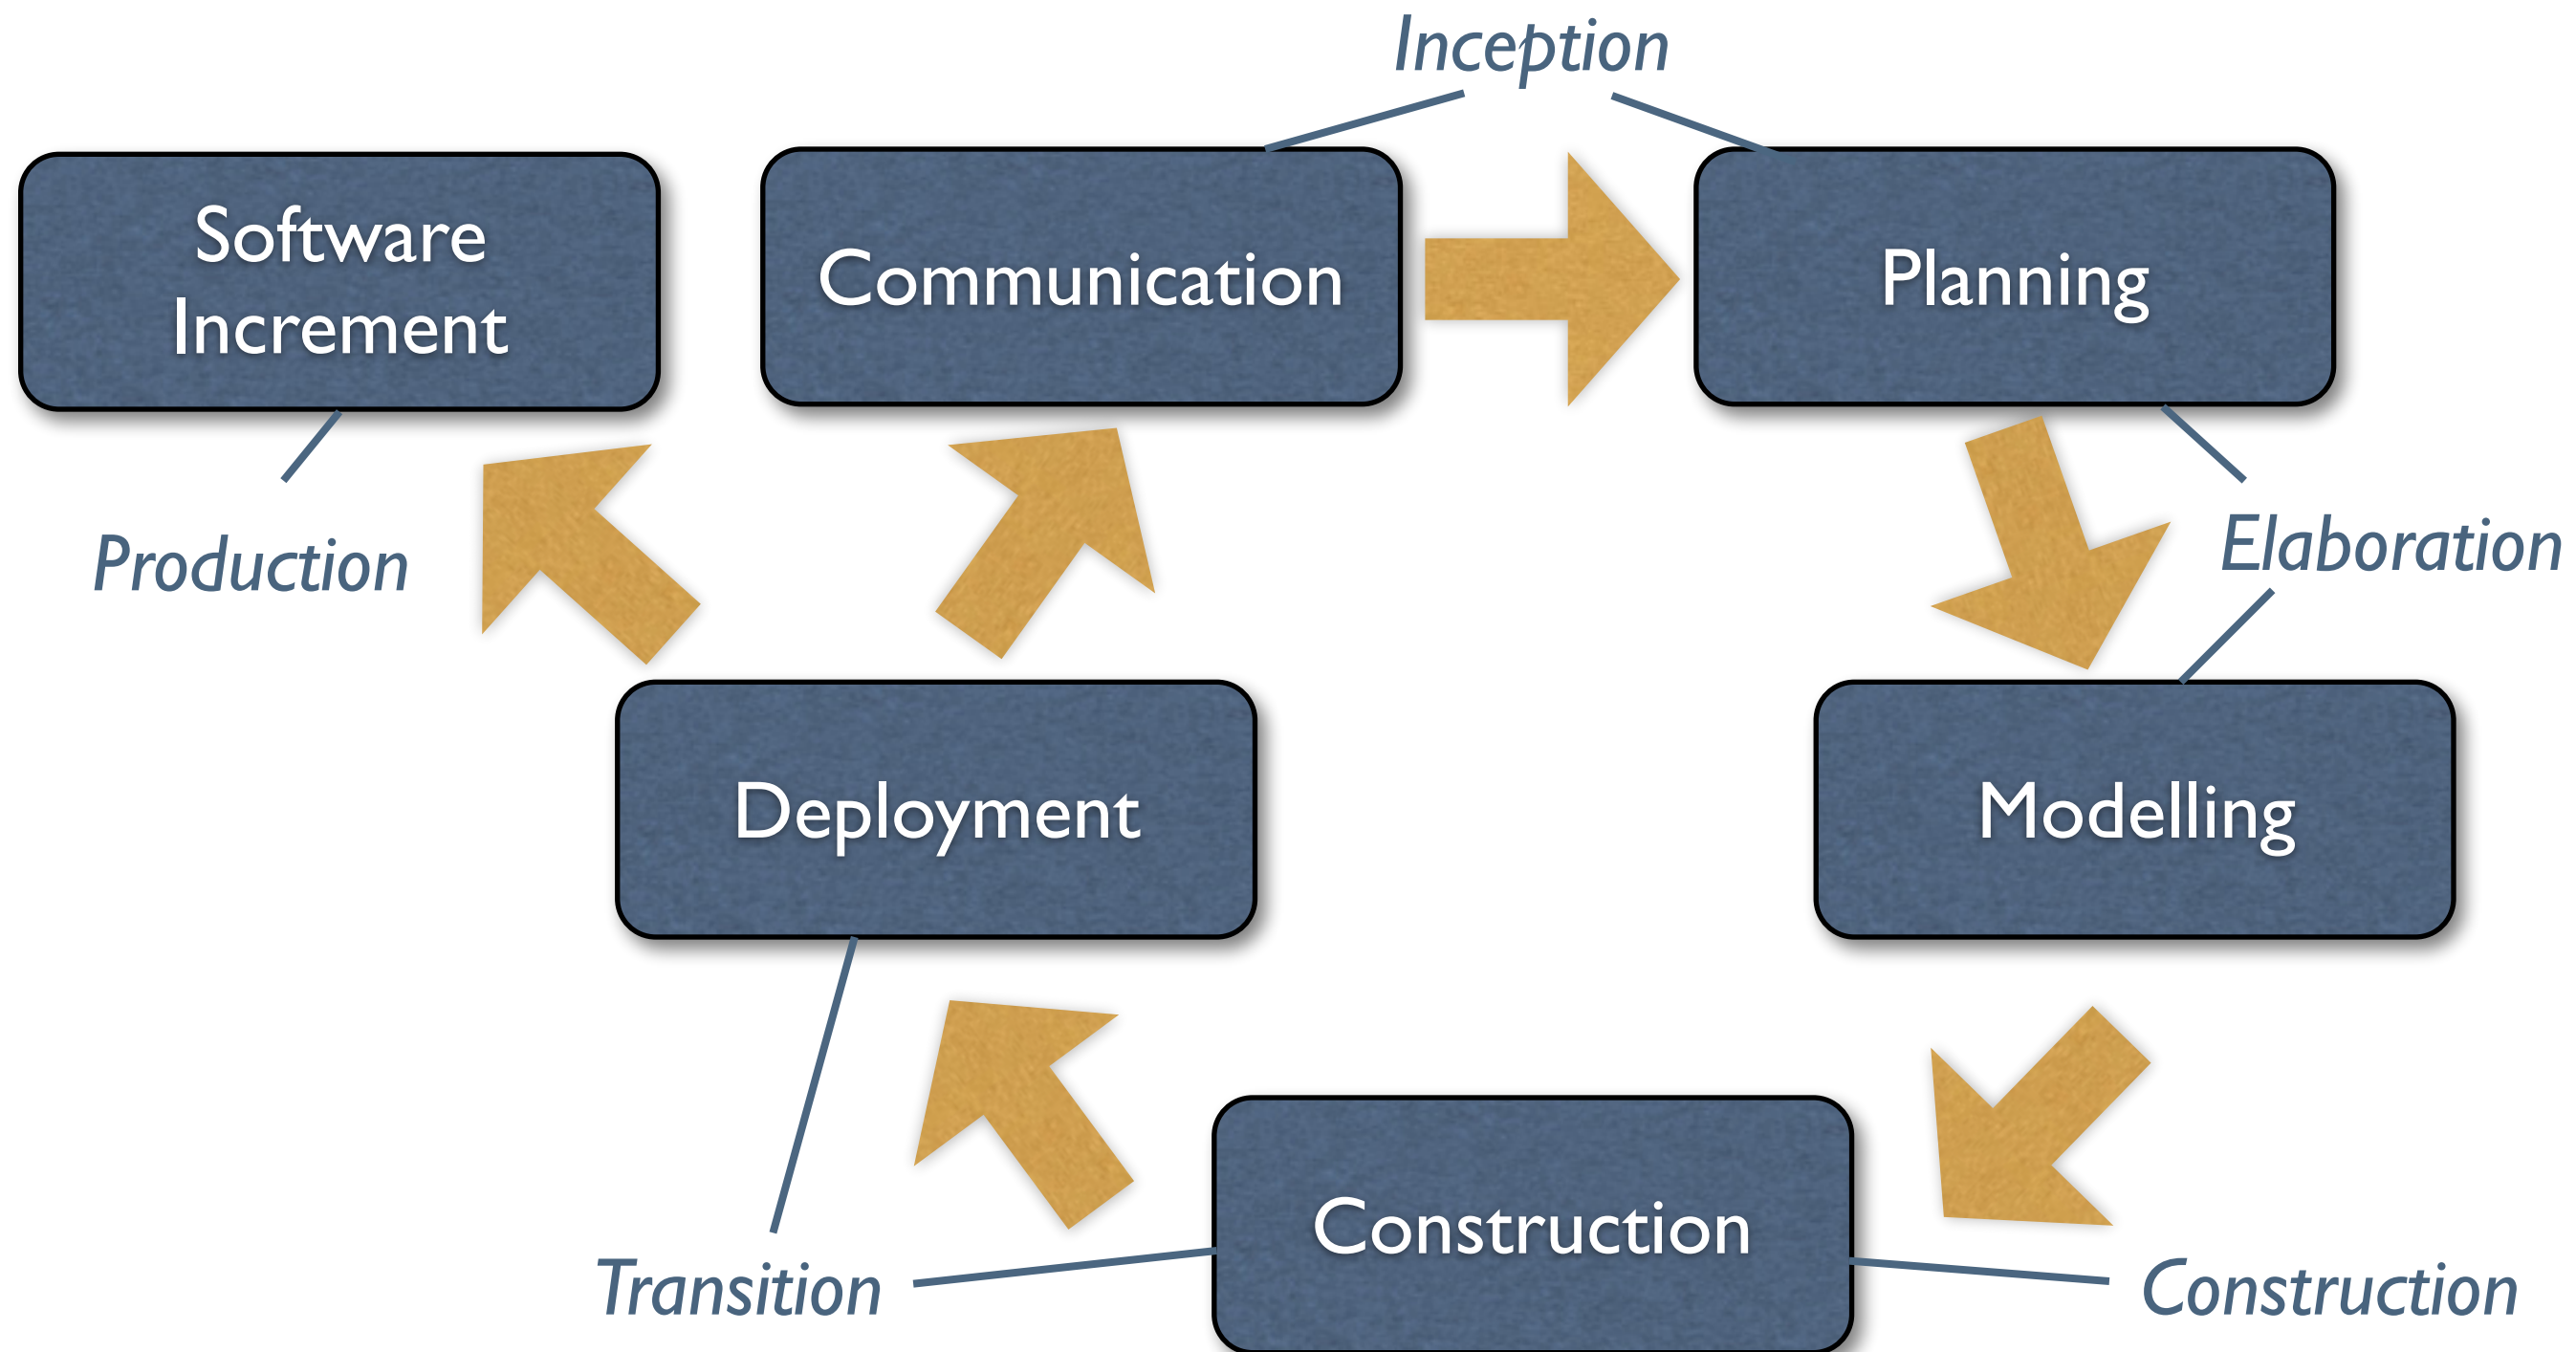

# Re-Iteration

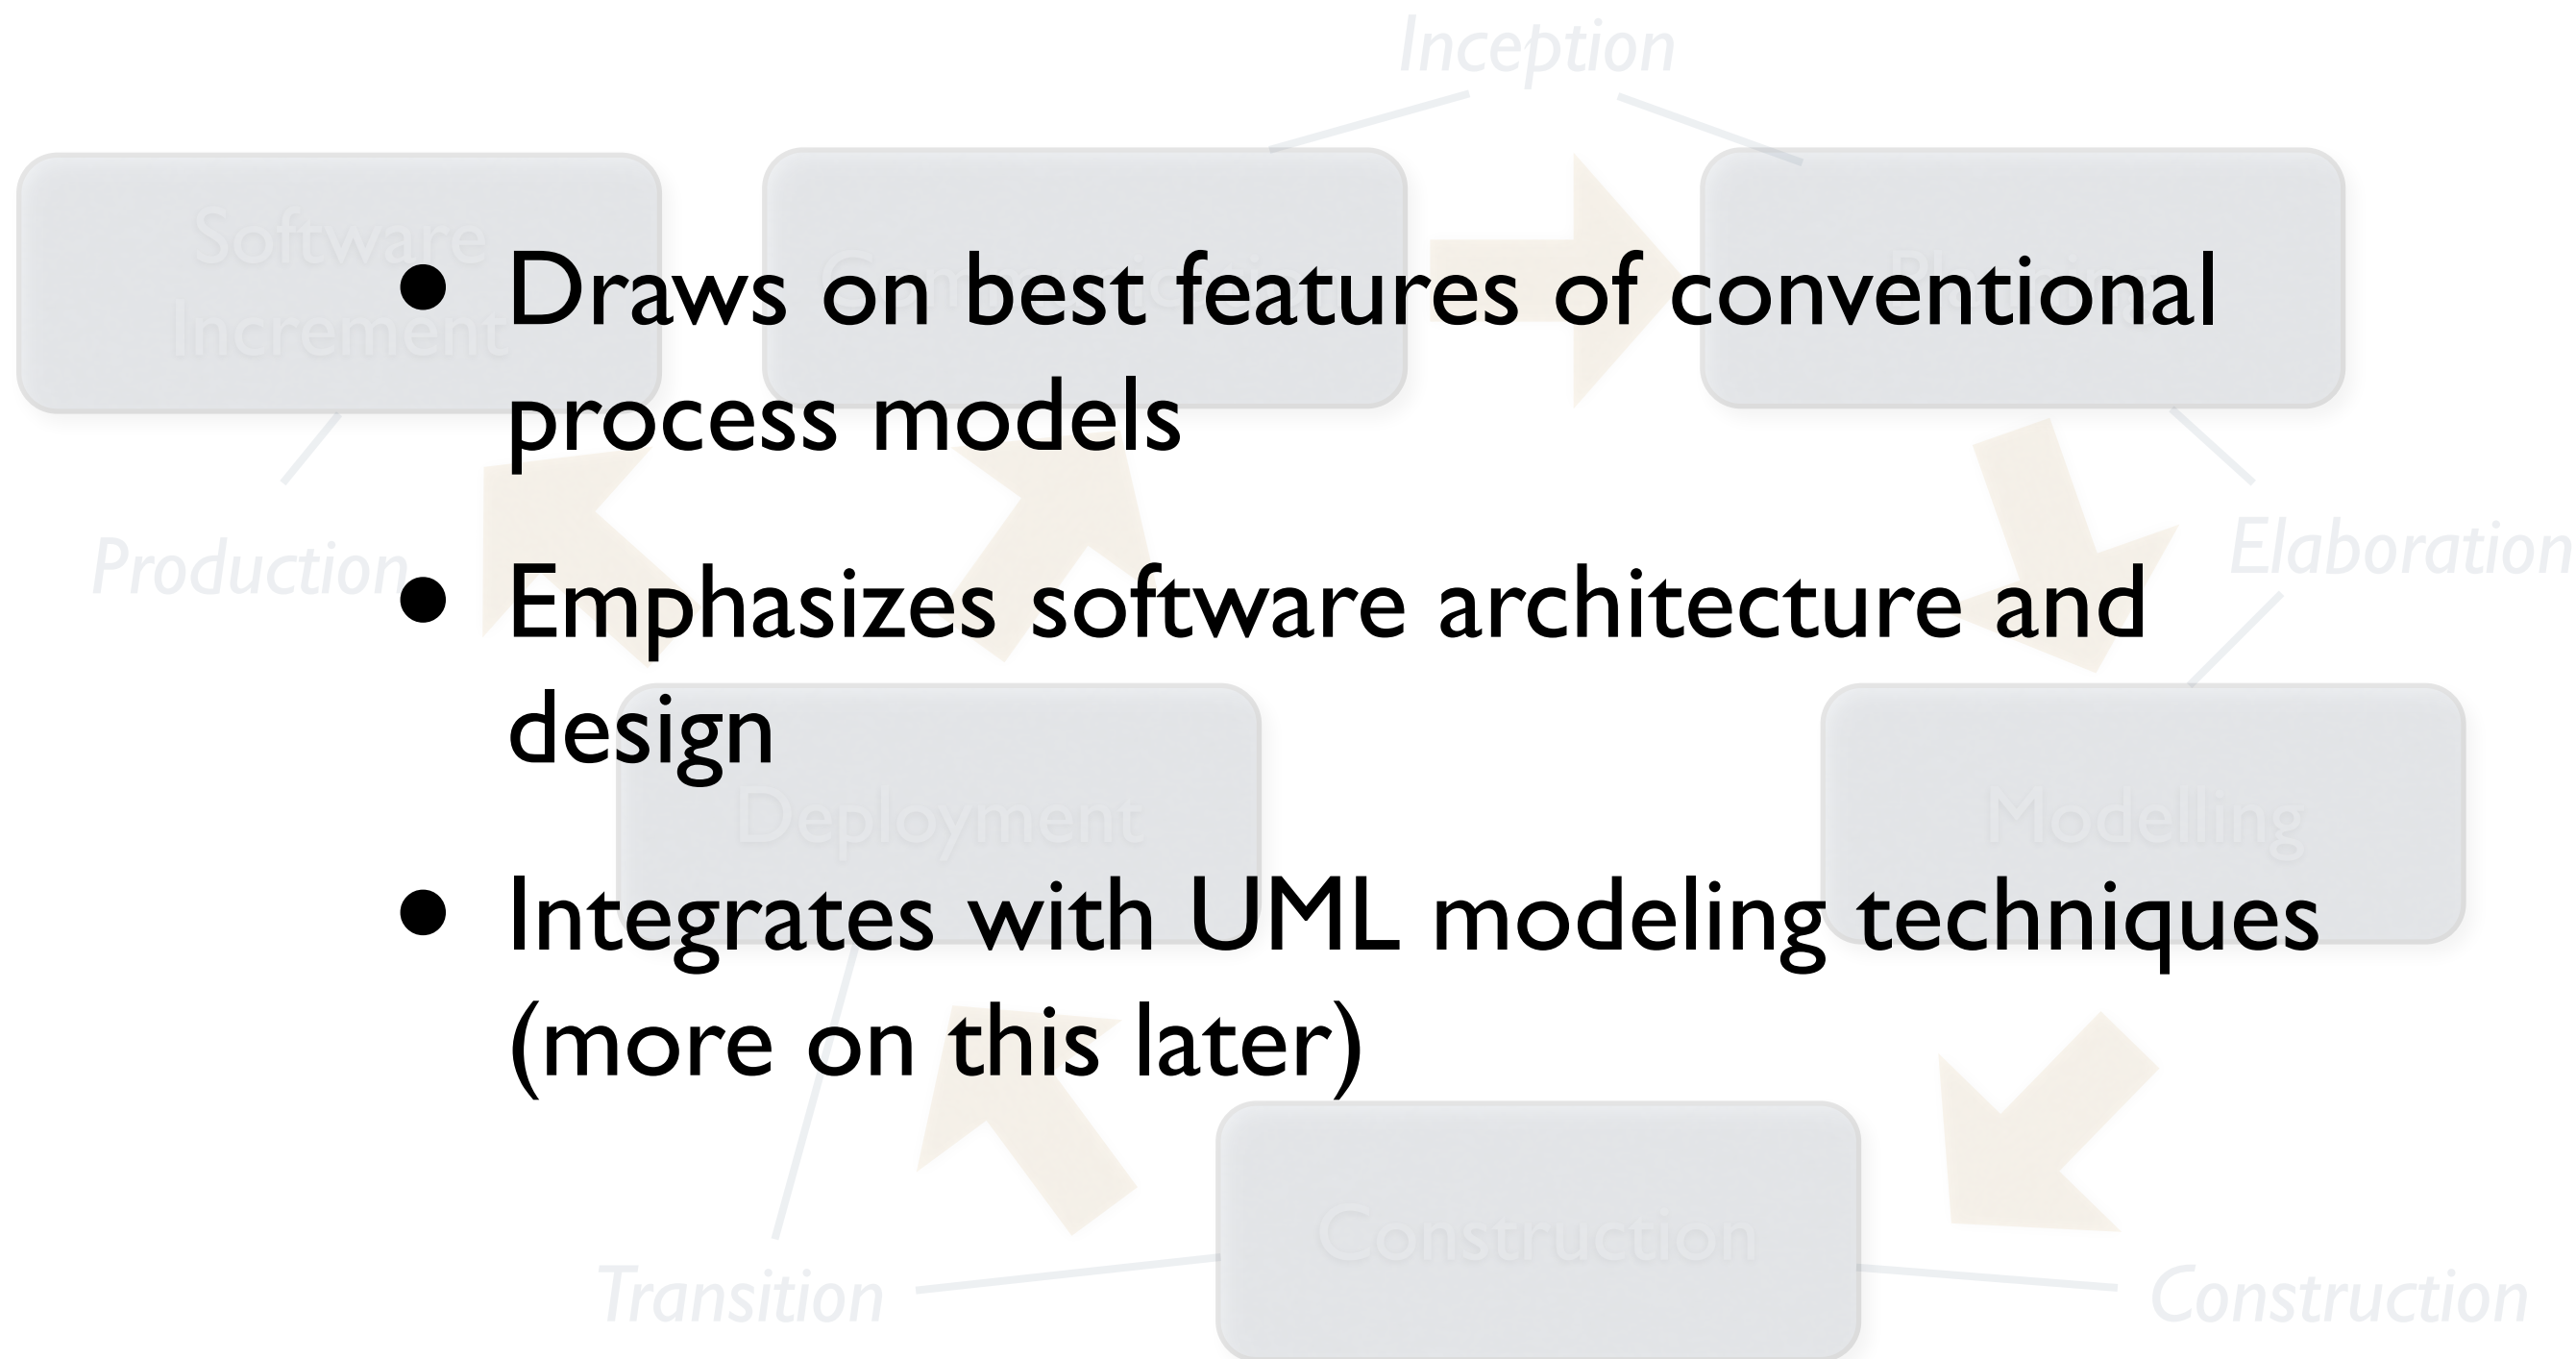

# Unified Process

# Unified Process

- Draws on best features of conventional process models
- Emphasizes software architecture and design
- Integrates with UML modeling techniques (more on this later)

# Agile Alliance

## Manifesto for Agile Software Development (2001)

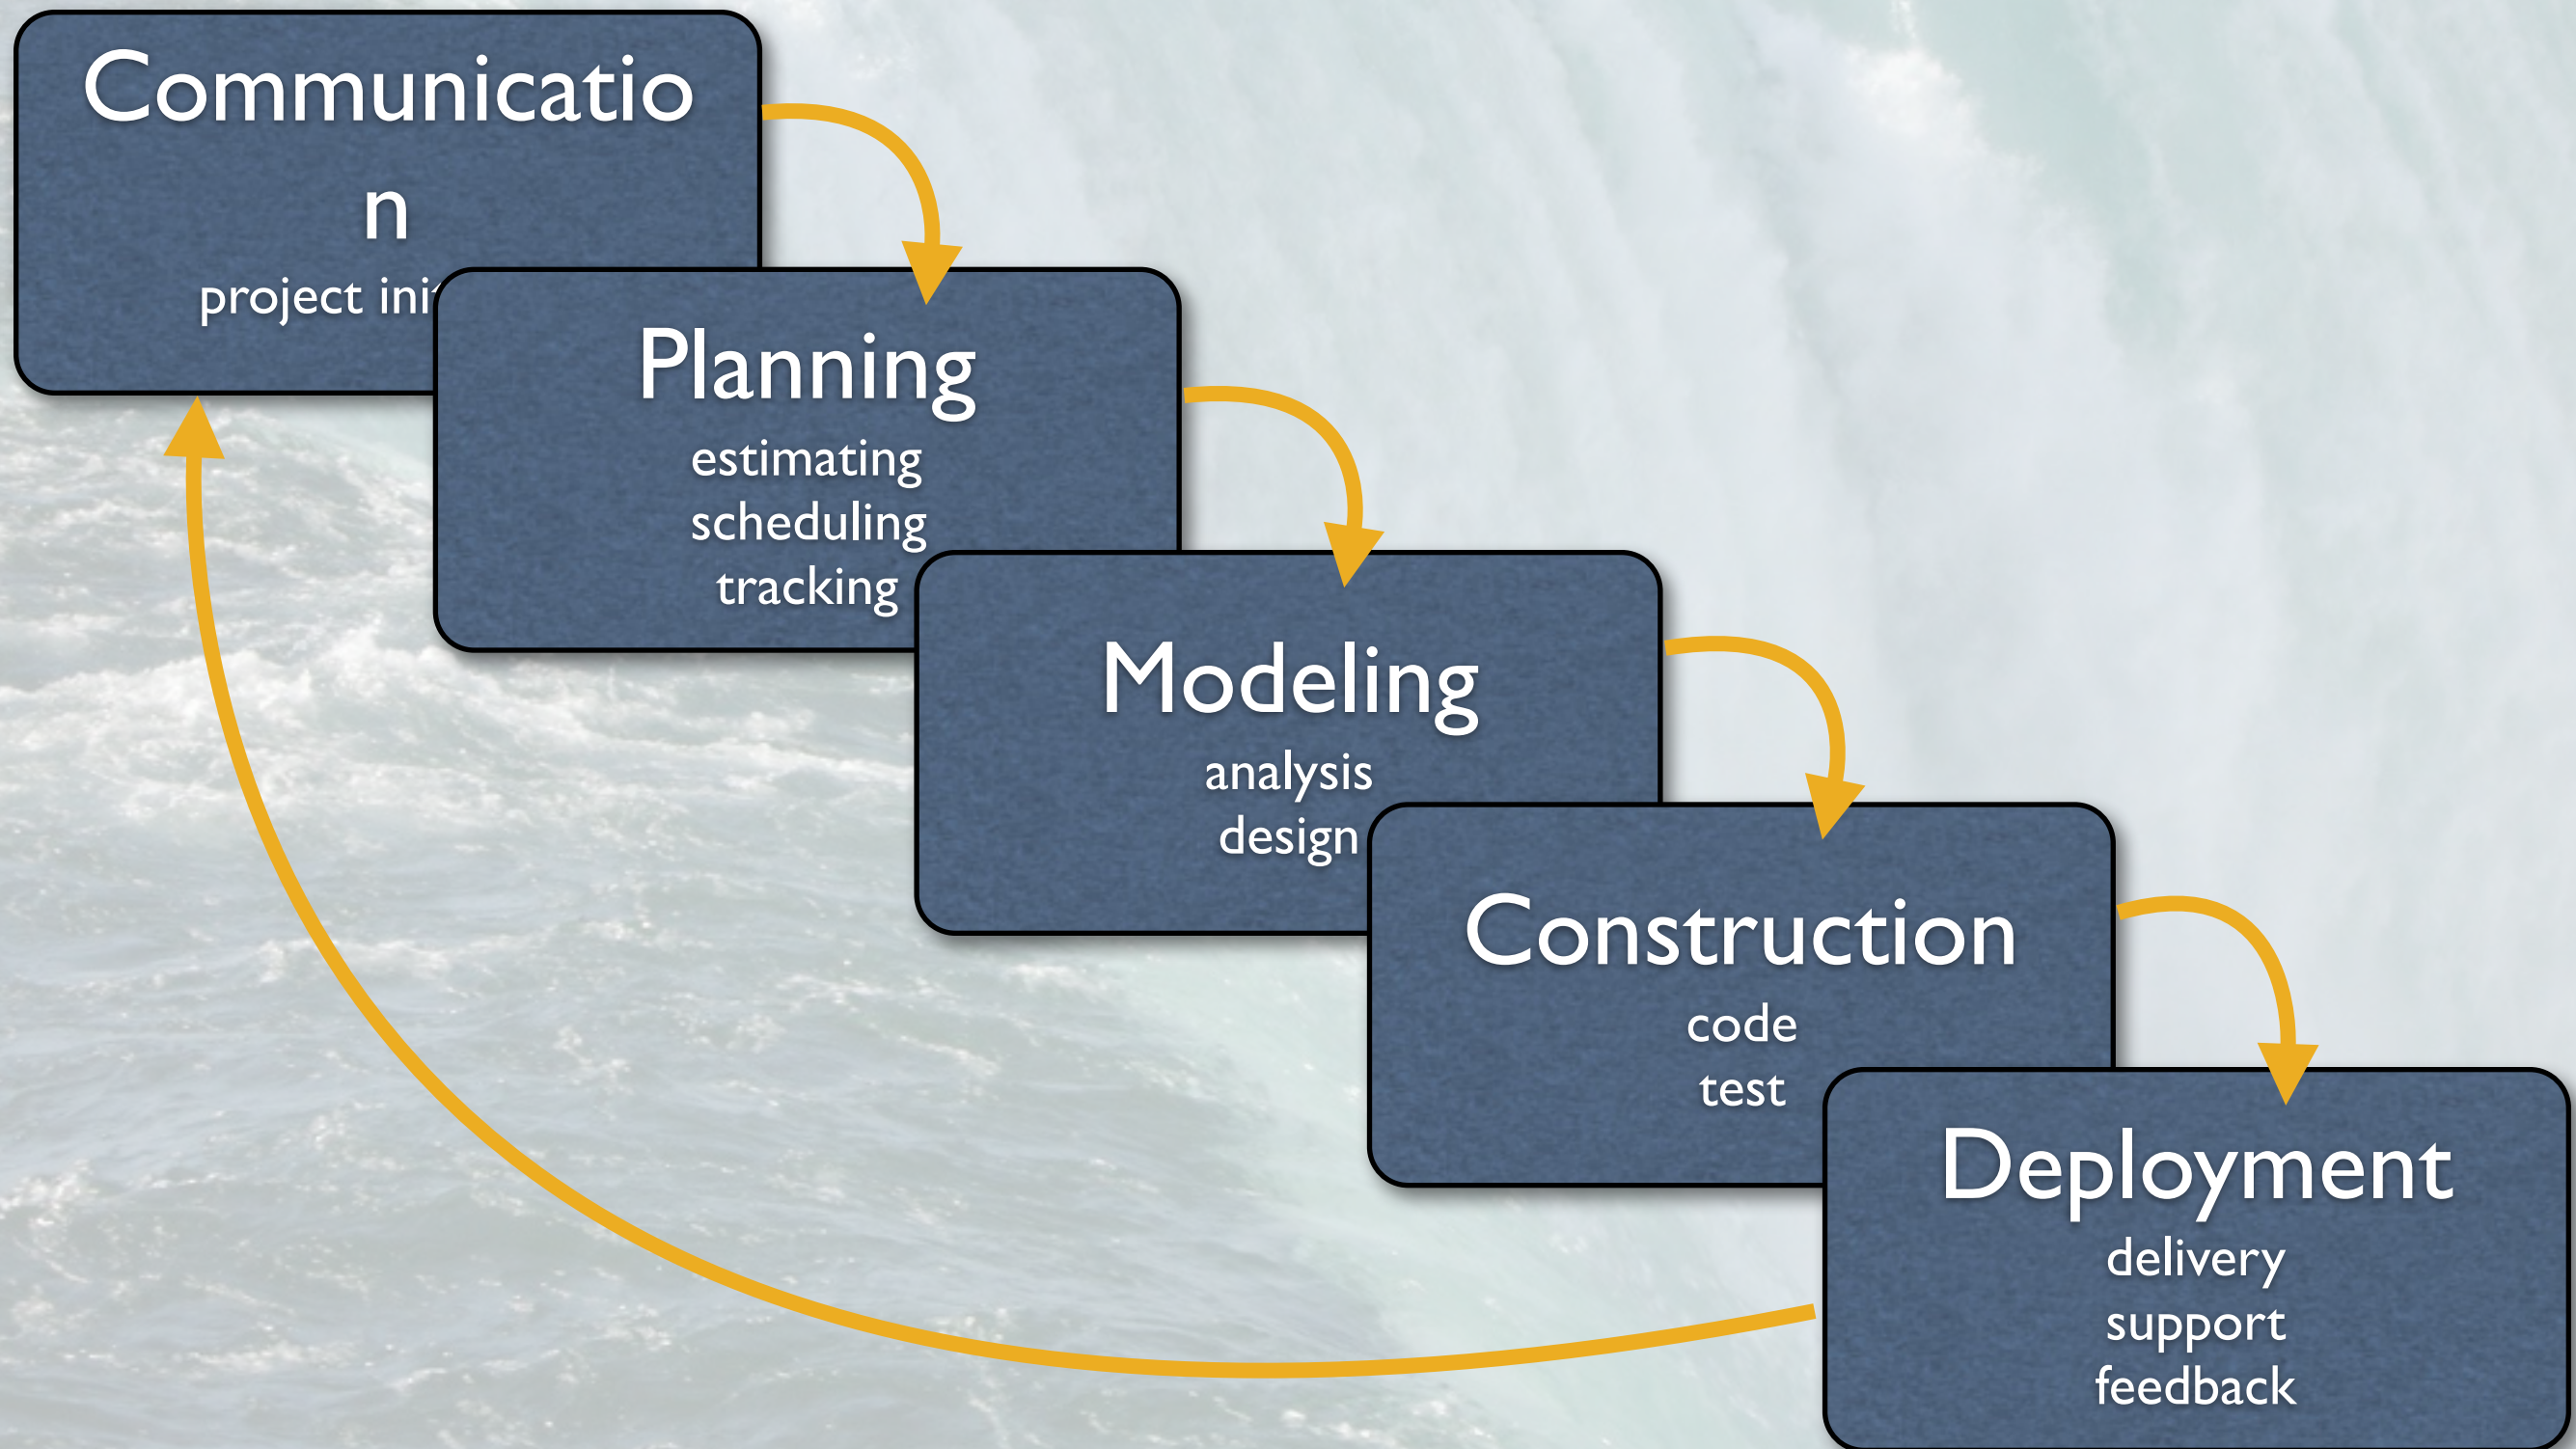

- Individuals and activities over processes and tools.
- Working software over comprehensive documentation.
- Customer collaboration over contract negotiation.
- Responding to change over following a plan..

# What is Agile Development?

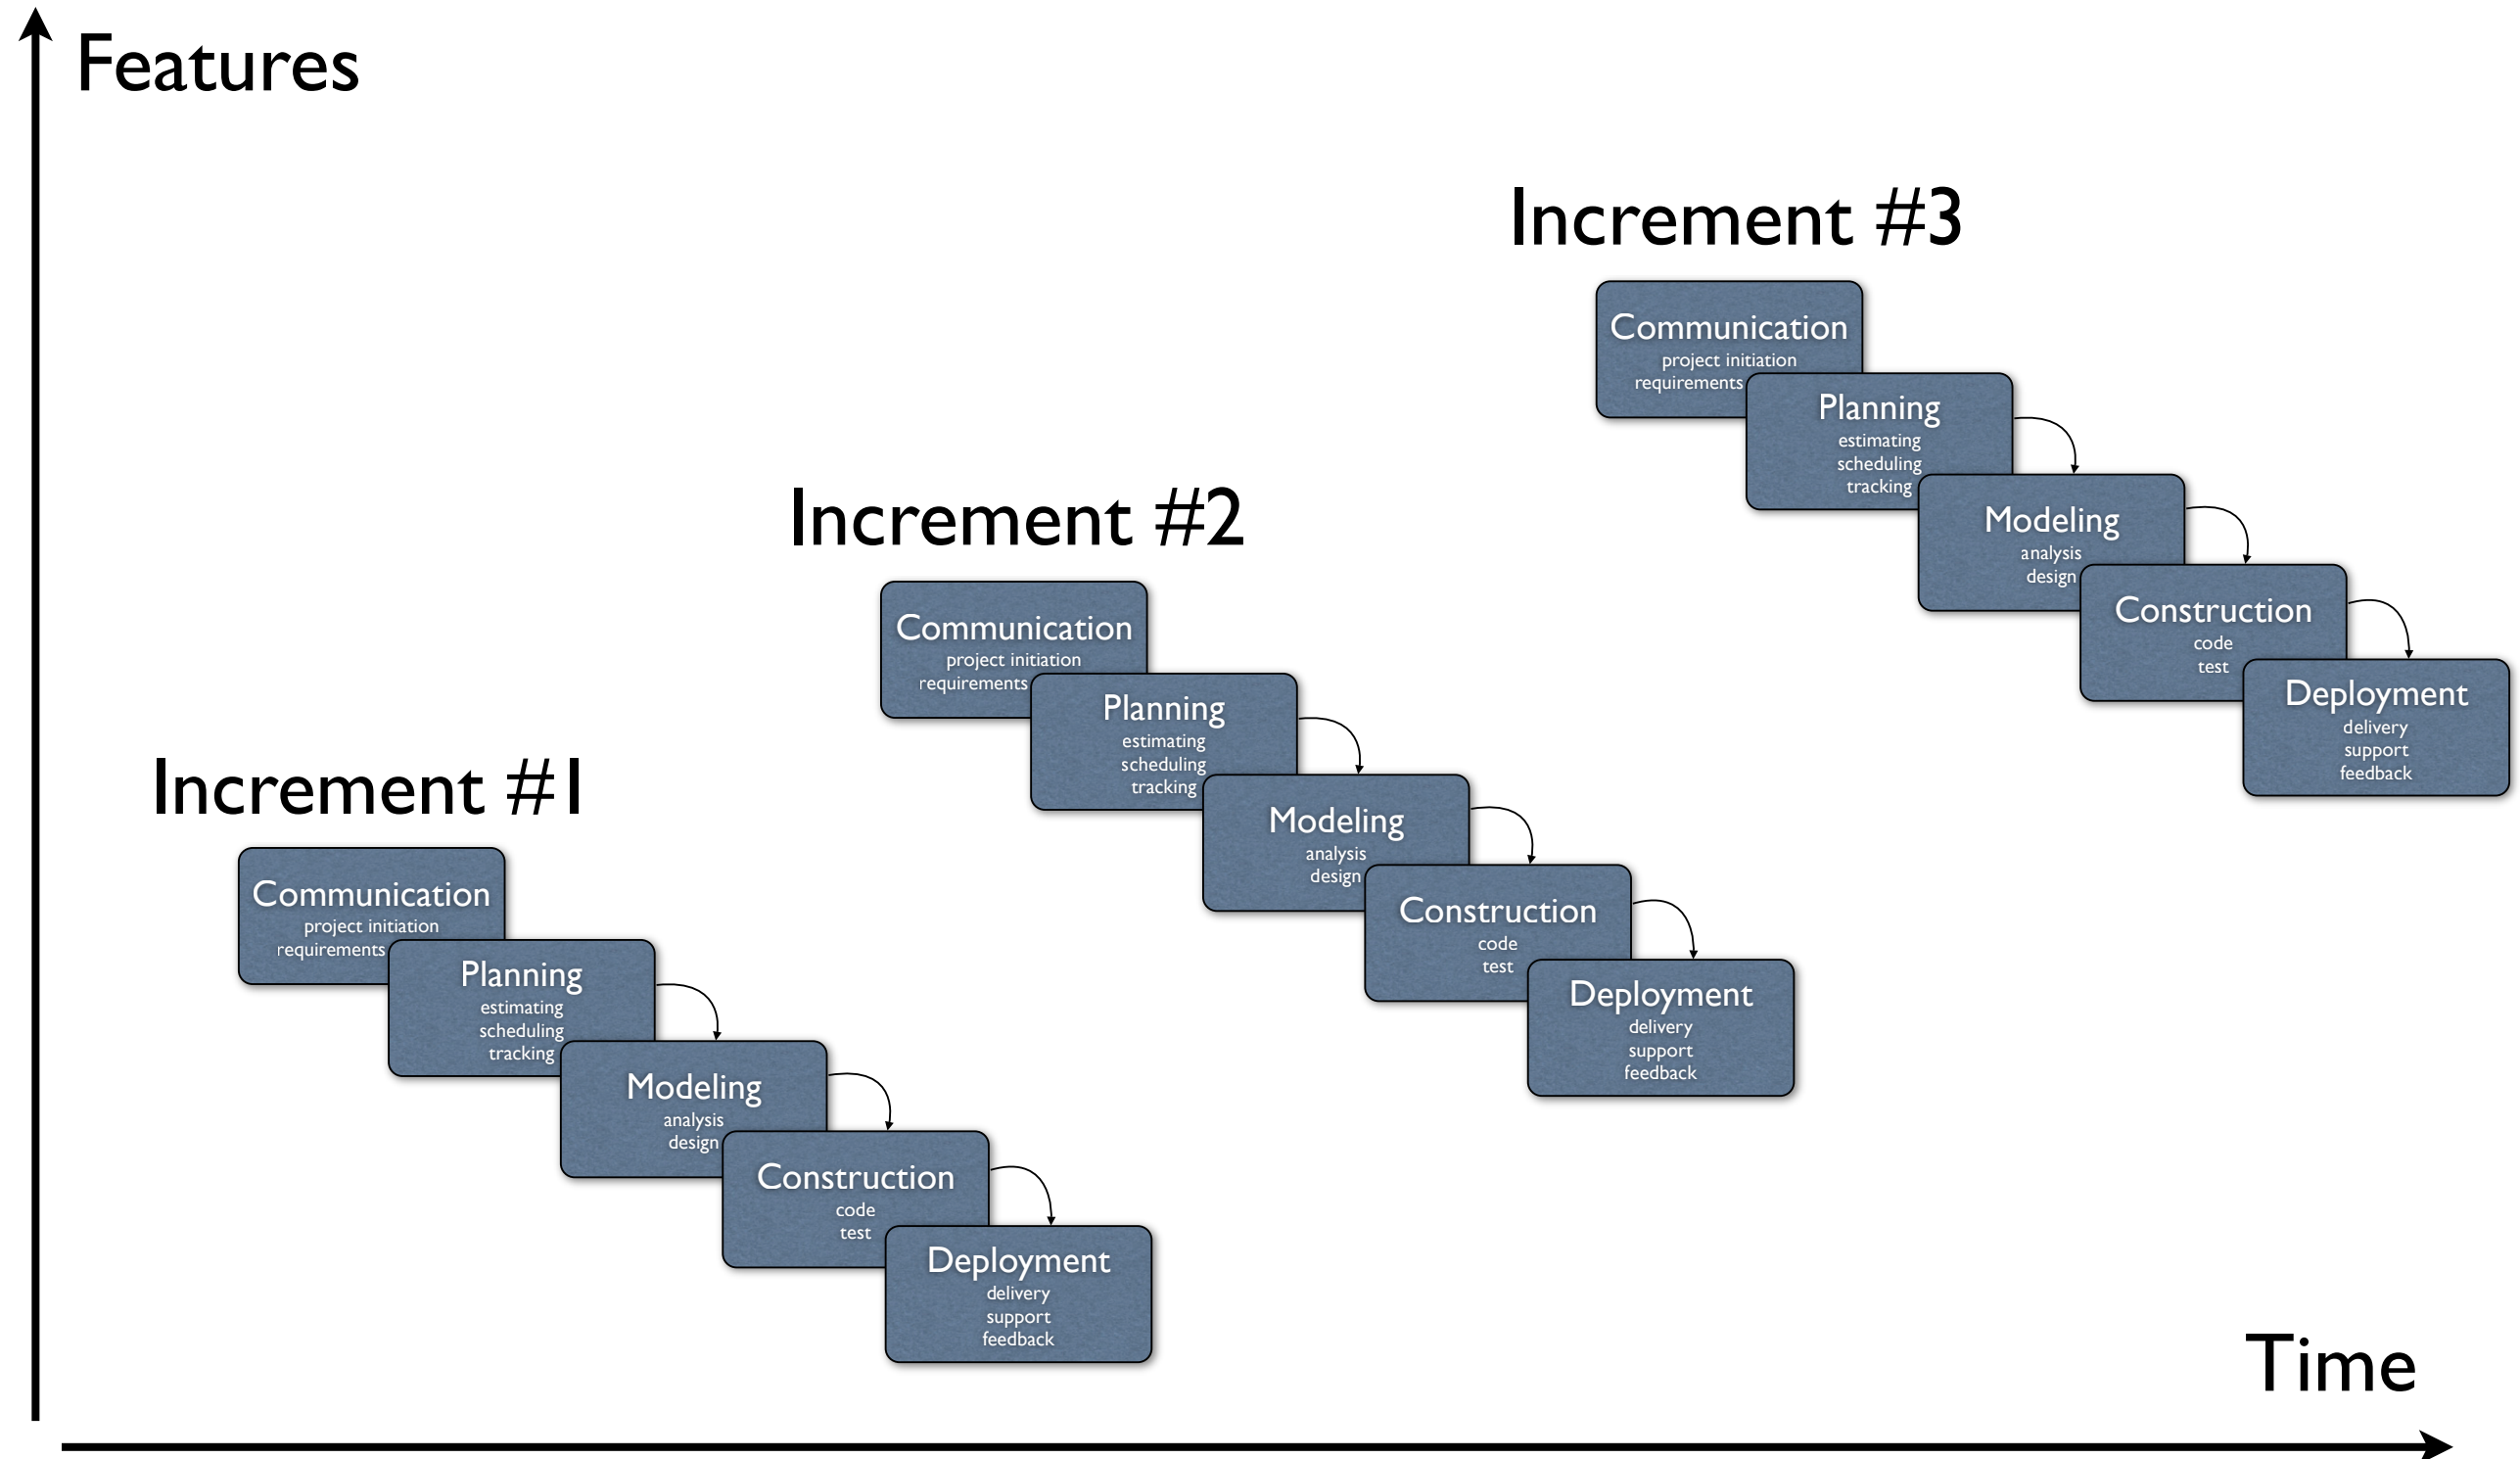

- Fast development? Hacking? Prototyping?  
Uncontrolled fun? Programmer heaven?
- Agility = ability to react to changing situations quickly, appropriately, and effectively.
  - notice changes early
  - initiate action promptly
  - create a feasible and effective alternative plan quickly
  - reorient work and resources quickly and effectively

# Agile?

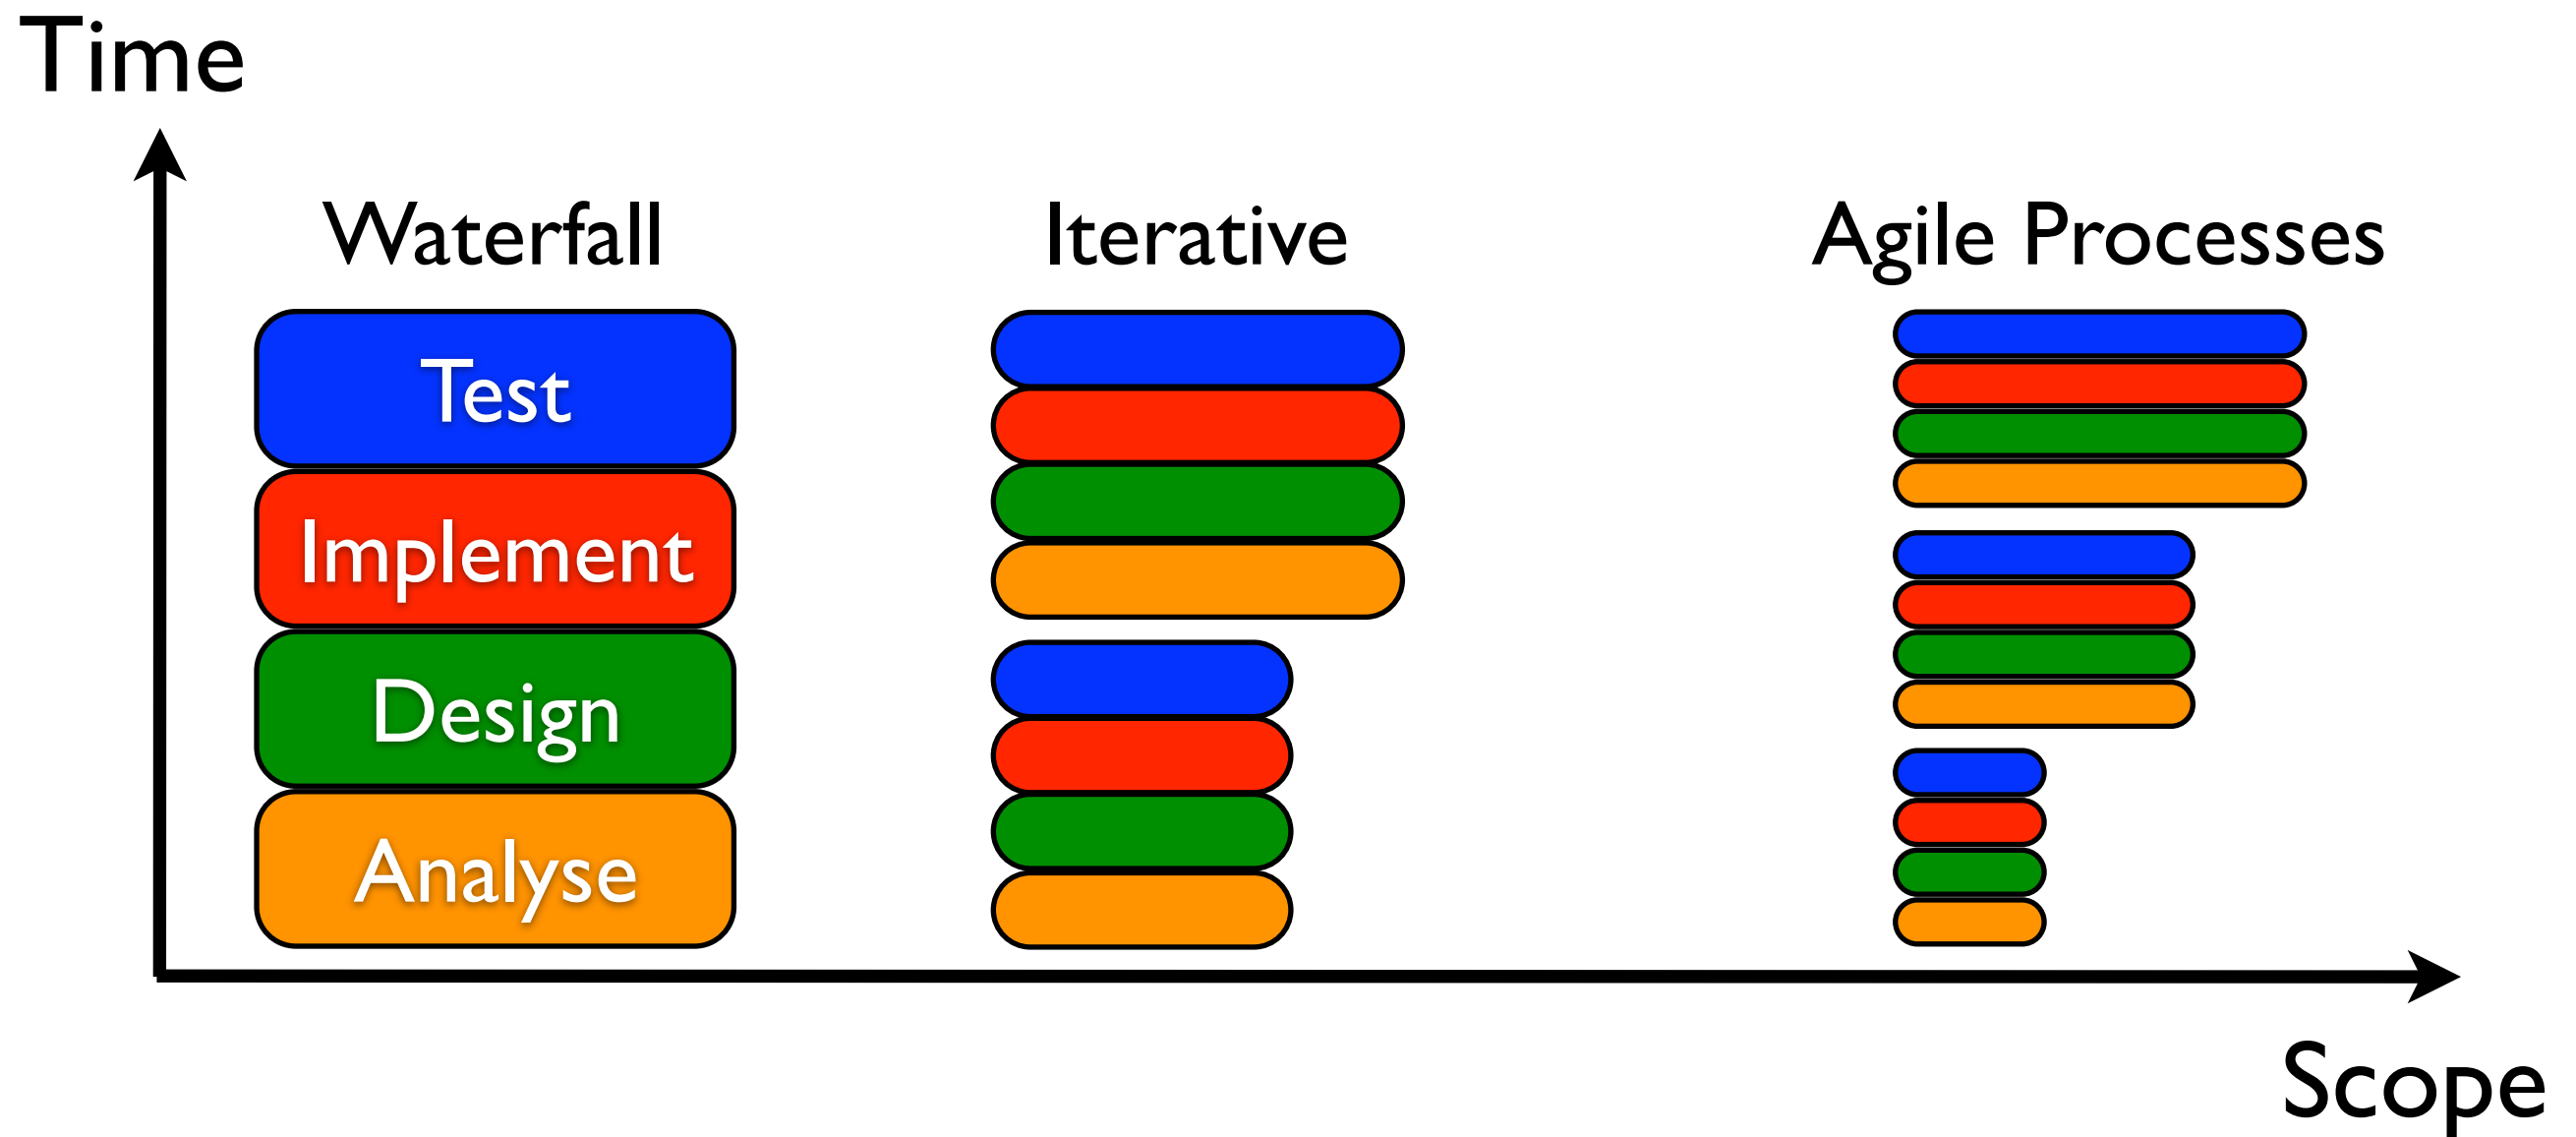

# Incremental Model

# Agile Processes

# Agile vs. Plan-driven

## Agile

- Low criticality
- Senior developers
- Requirements change very often
- Small number of developers
- Culture that thrives on chaos

## Plan-driven

- High criticality
- Junior developers
- Requirements don't change too often
- Large number of developers
- Culture that demands order

# What is an Agile Process?

- Difficult to predict which requirements will persist or change in the future.
- For many types of software, design and development are interleaved.
- Analysis, design, construction, and testing are not as predictable.

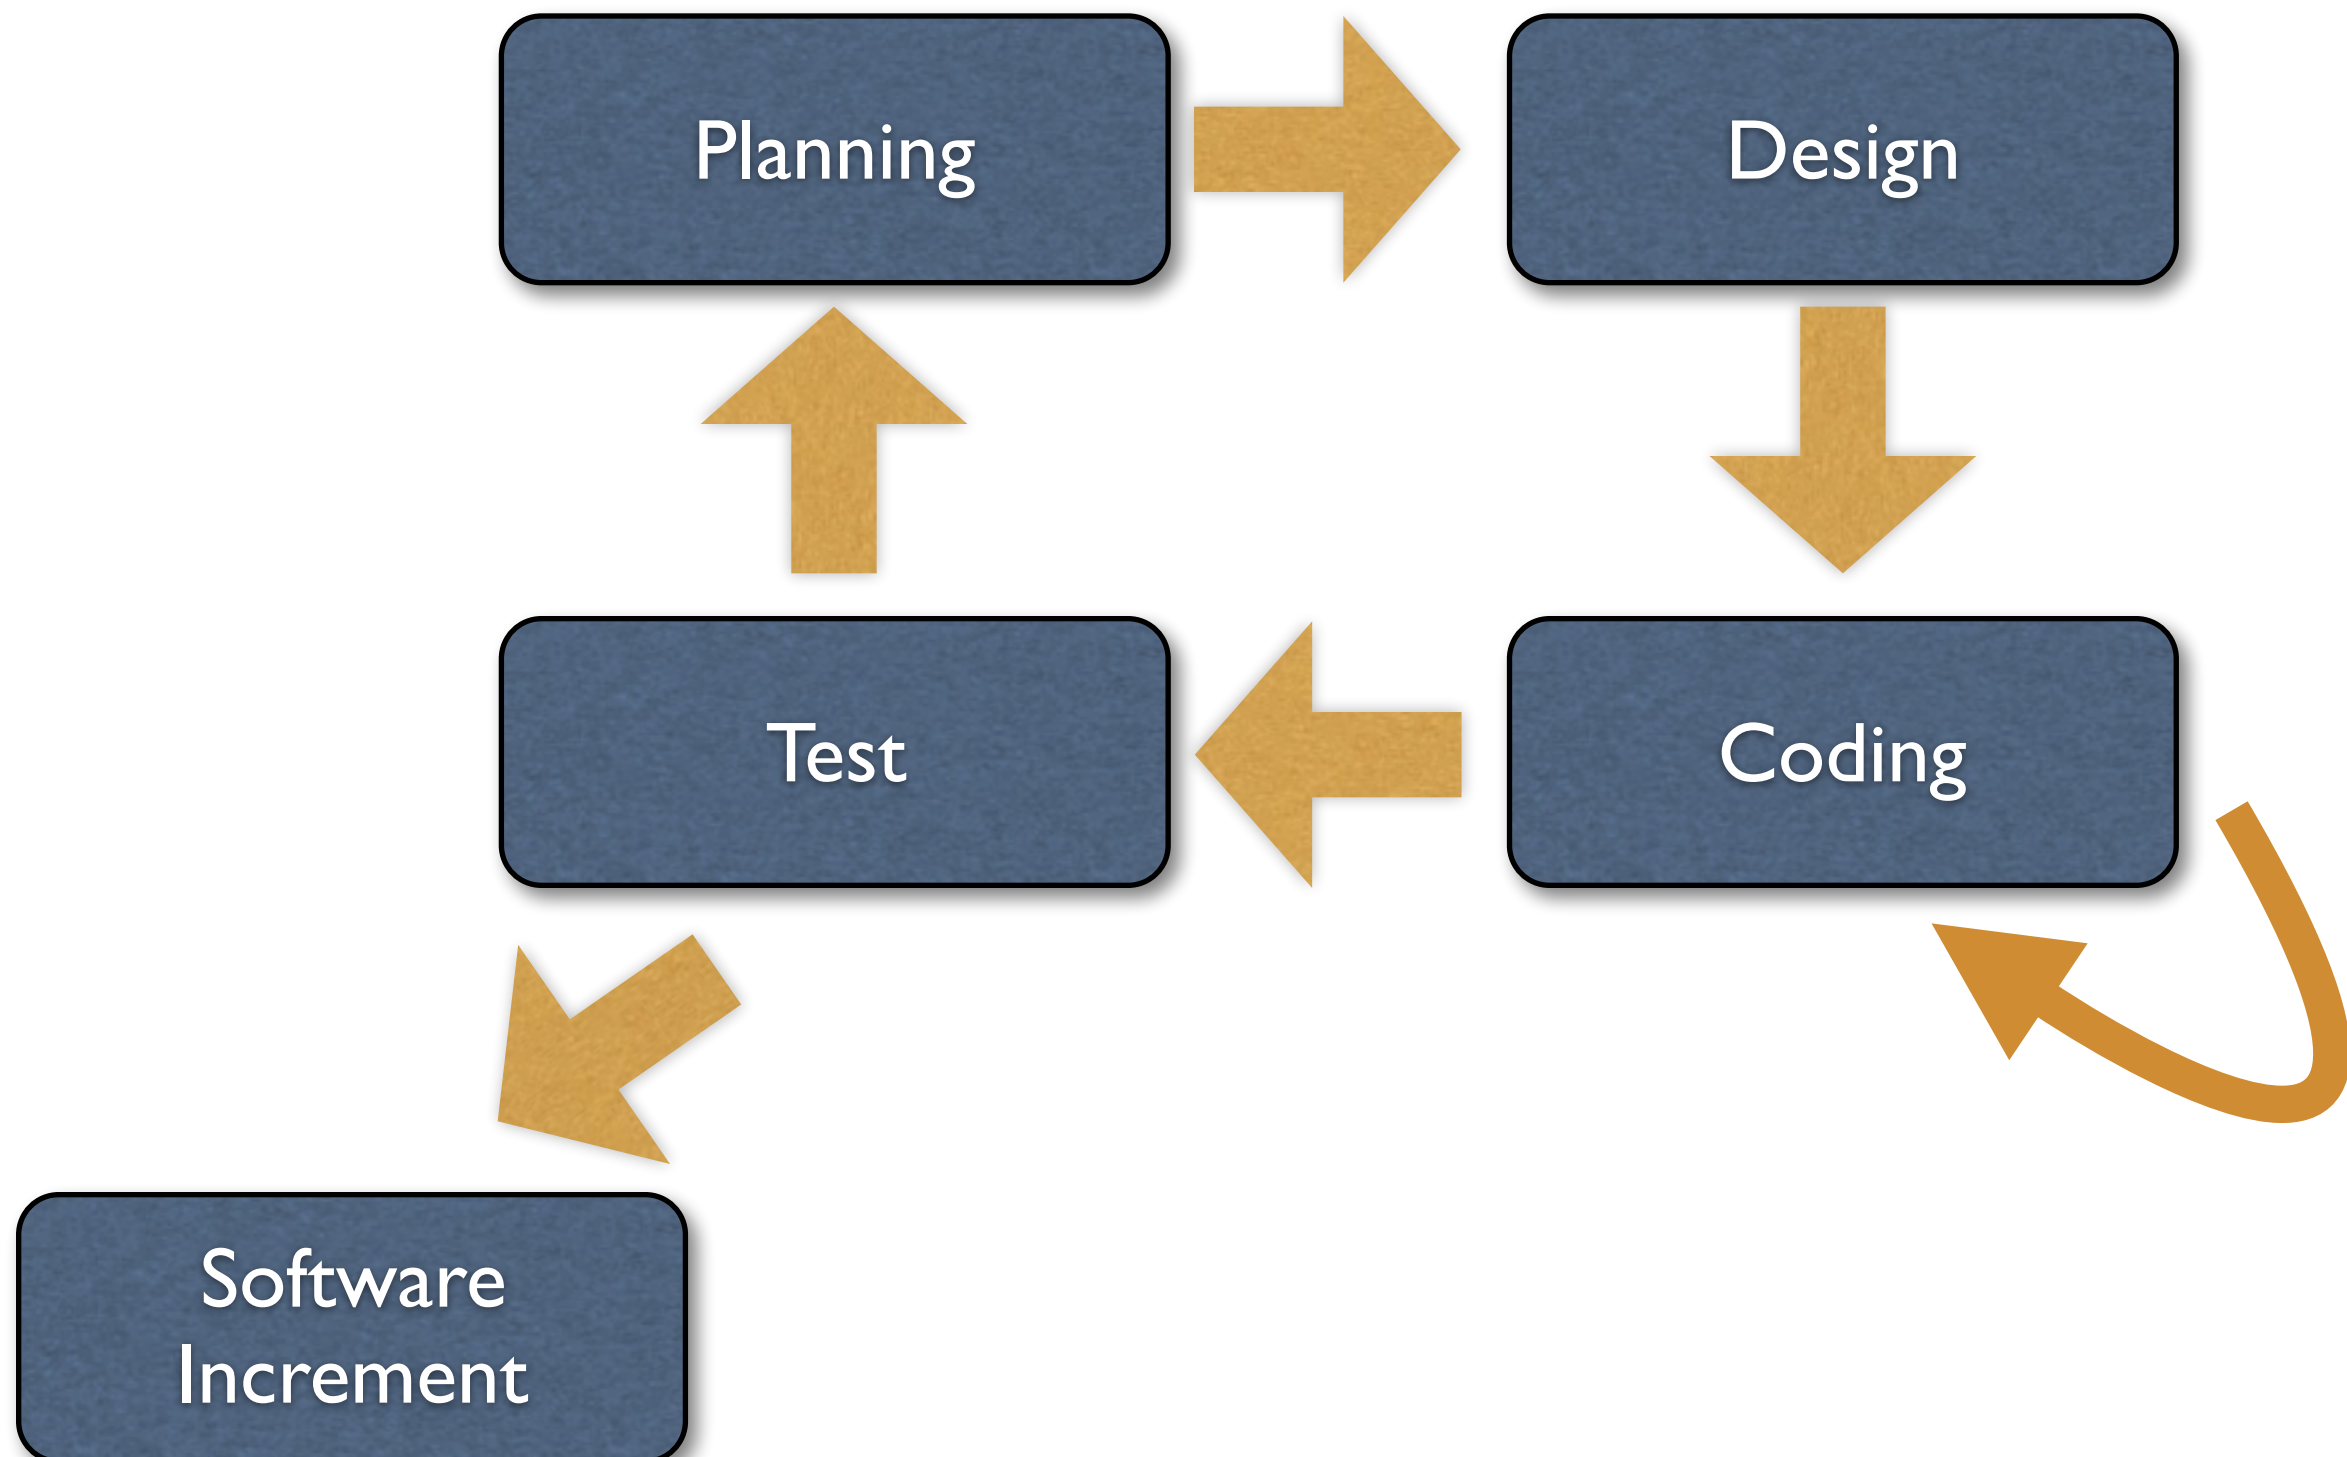

# So, how to tackle unpredictability?

make the process adaptable...

# Extreme Programming

(1999–)

# Planning

## Planning

- In XP, planning takes place by means of *stories*
- Each story captures essential behavior

I want to be able to create a new Booking, entering all the details from scratch but in any order that suits the customer, check for availability at any point that there is sufficient data, and confirm the booking when it is complete. The only pre-existing objects will be the Cities where we provide service. **1**

At any stage during the creation of a Booking I want to be able to create a return-journey Booking. All relevant details will be copied across into the return Booking, with the pick-up and drop-off locations reversed. **2**

I want any Payment Method, and Telephone created in a Booking to be associated directly with the Customer, so I can re-use them in a future booking. Where there are multiple Payment Methods and Telephones, I want the customer to be able to specify which is the preferred one. **3**

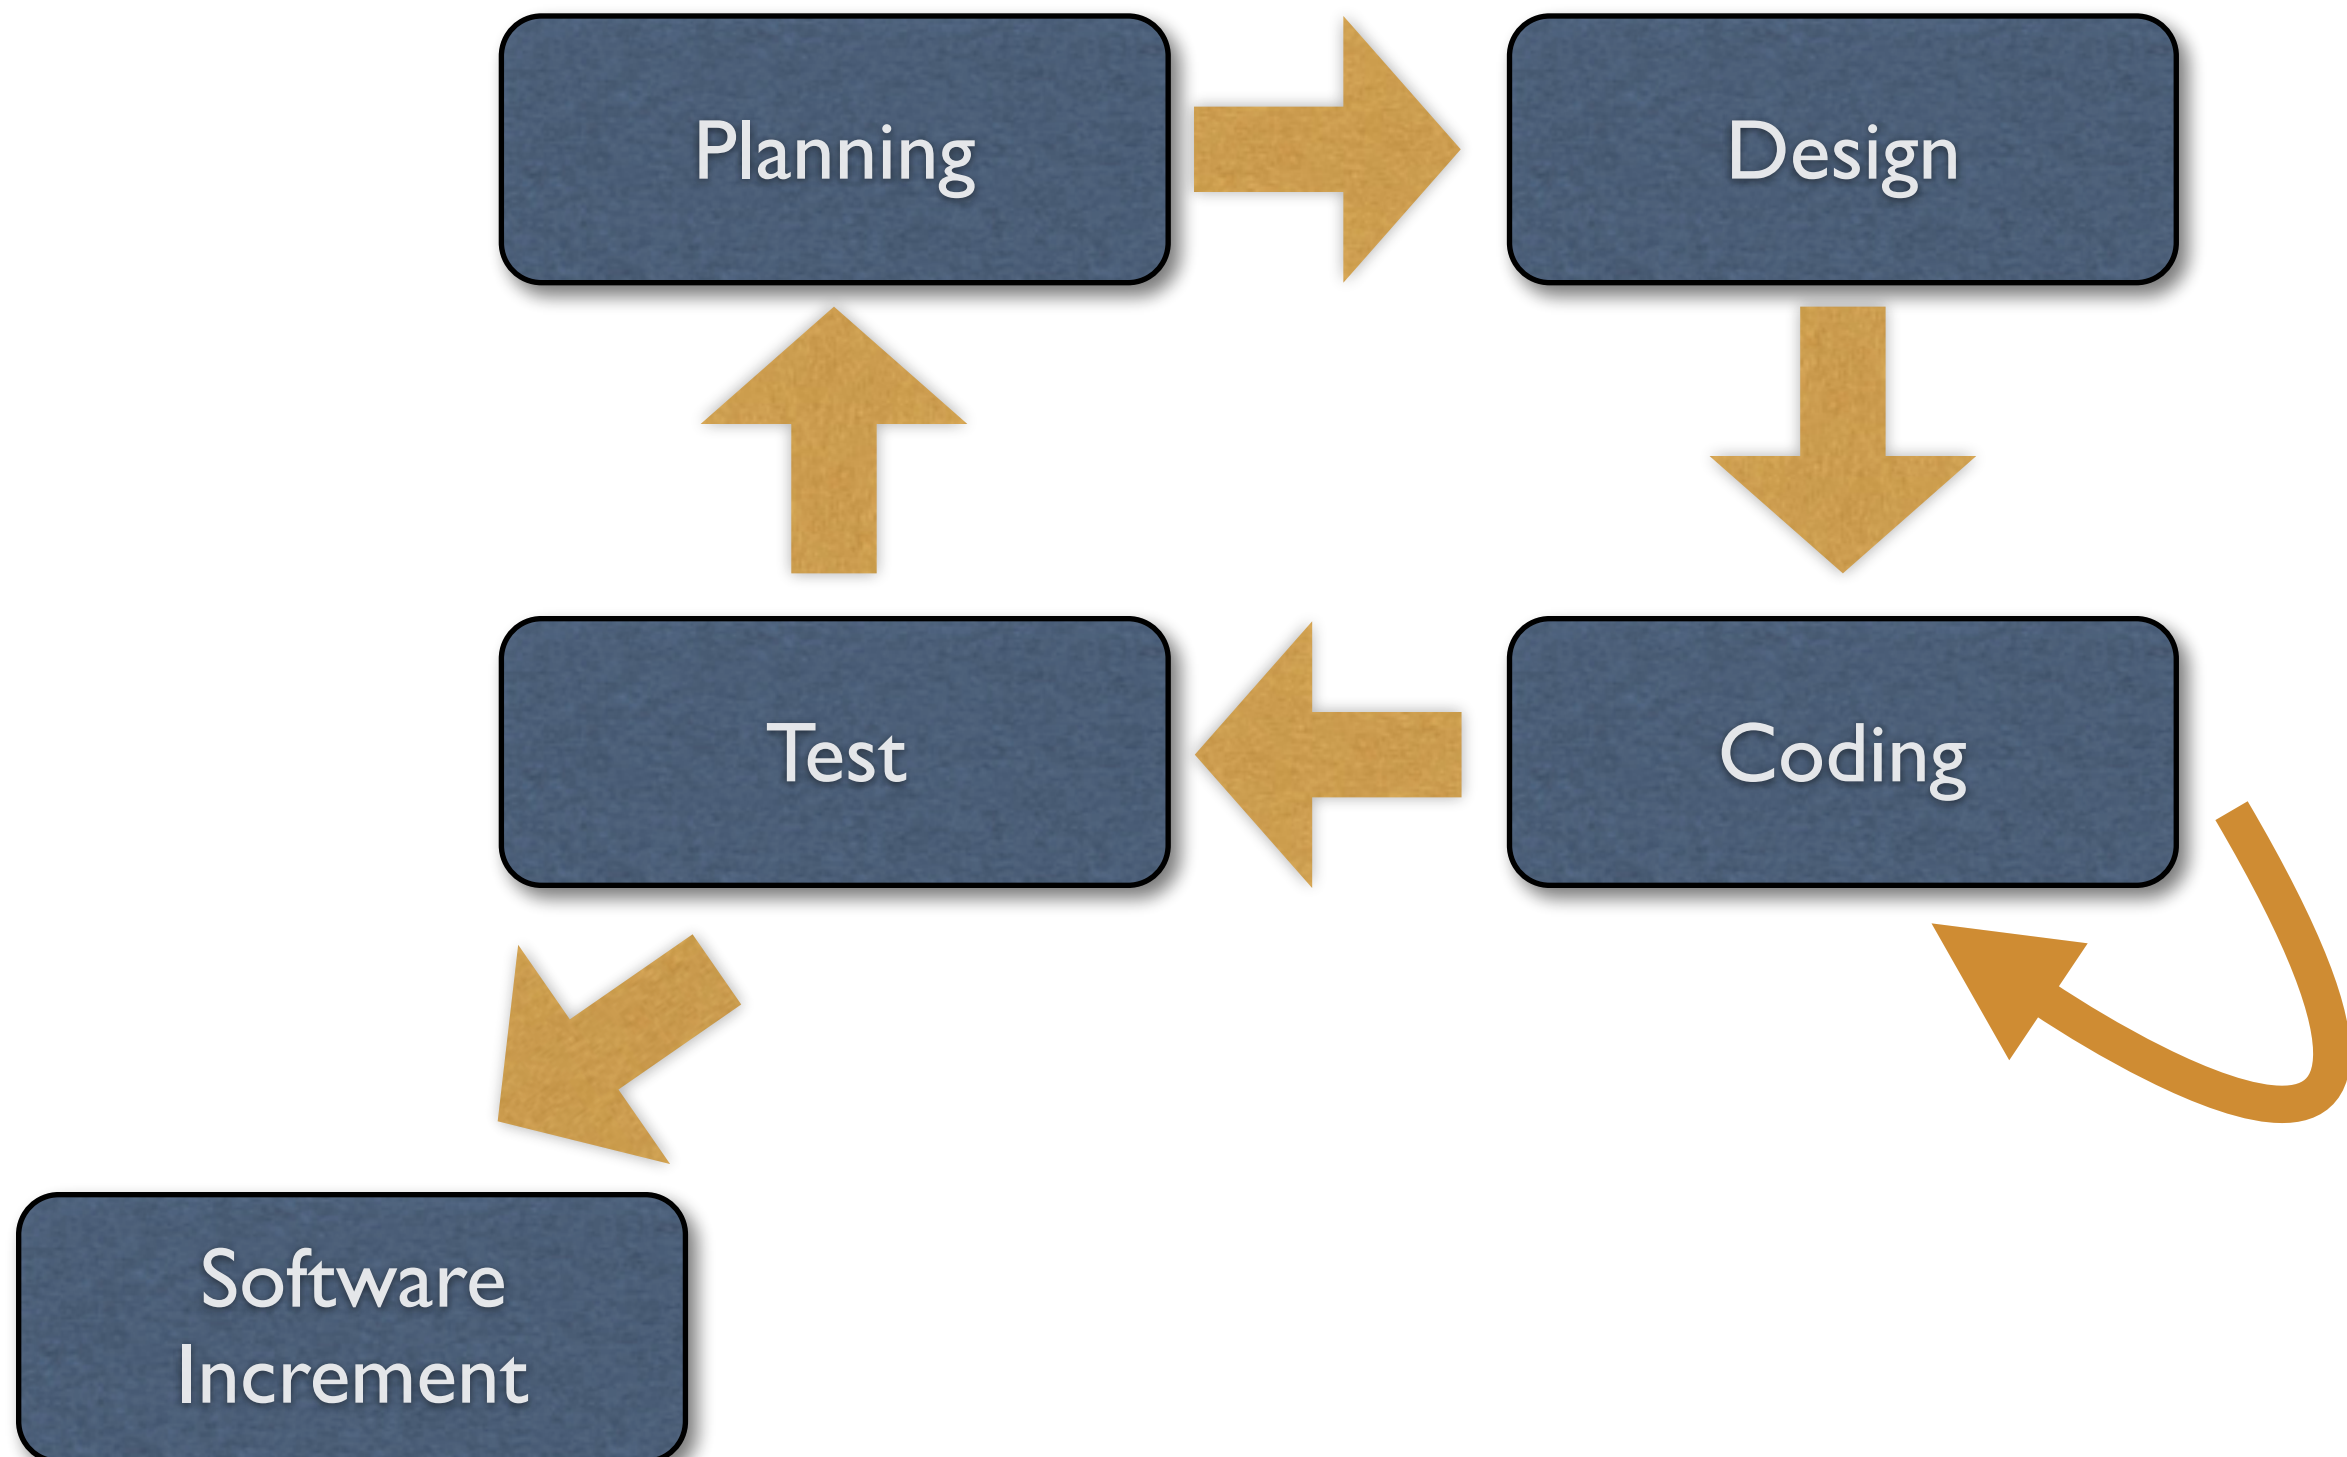

I want to be able to create a new Booking from within the Customer object, where the Customer, and the preferred Payment Method and Telephone are copied in automatically. **4**

I want the Customer object to be able to store Locations used by that customer and to give them 'nicknames', with the most frequently used Locations at the top of the list. **5**

I want a City object to hold a list of common locations (e.g. Airports, Theatres). **6**

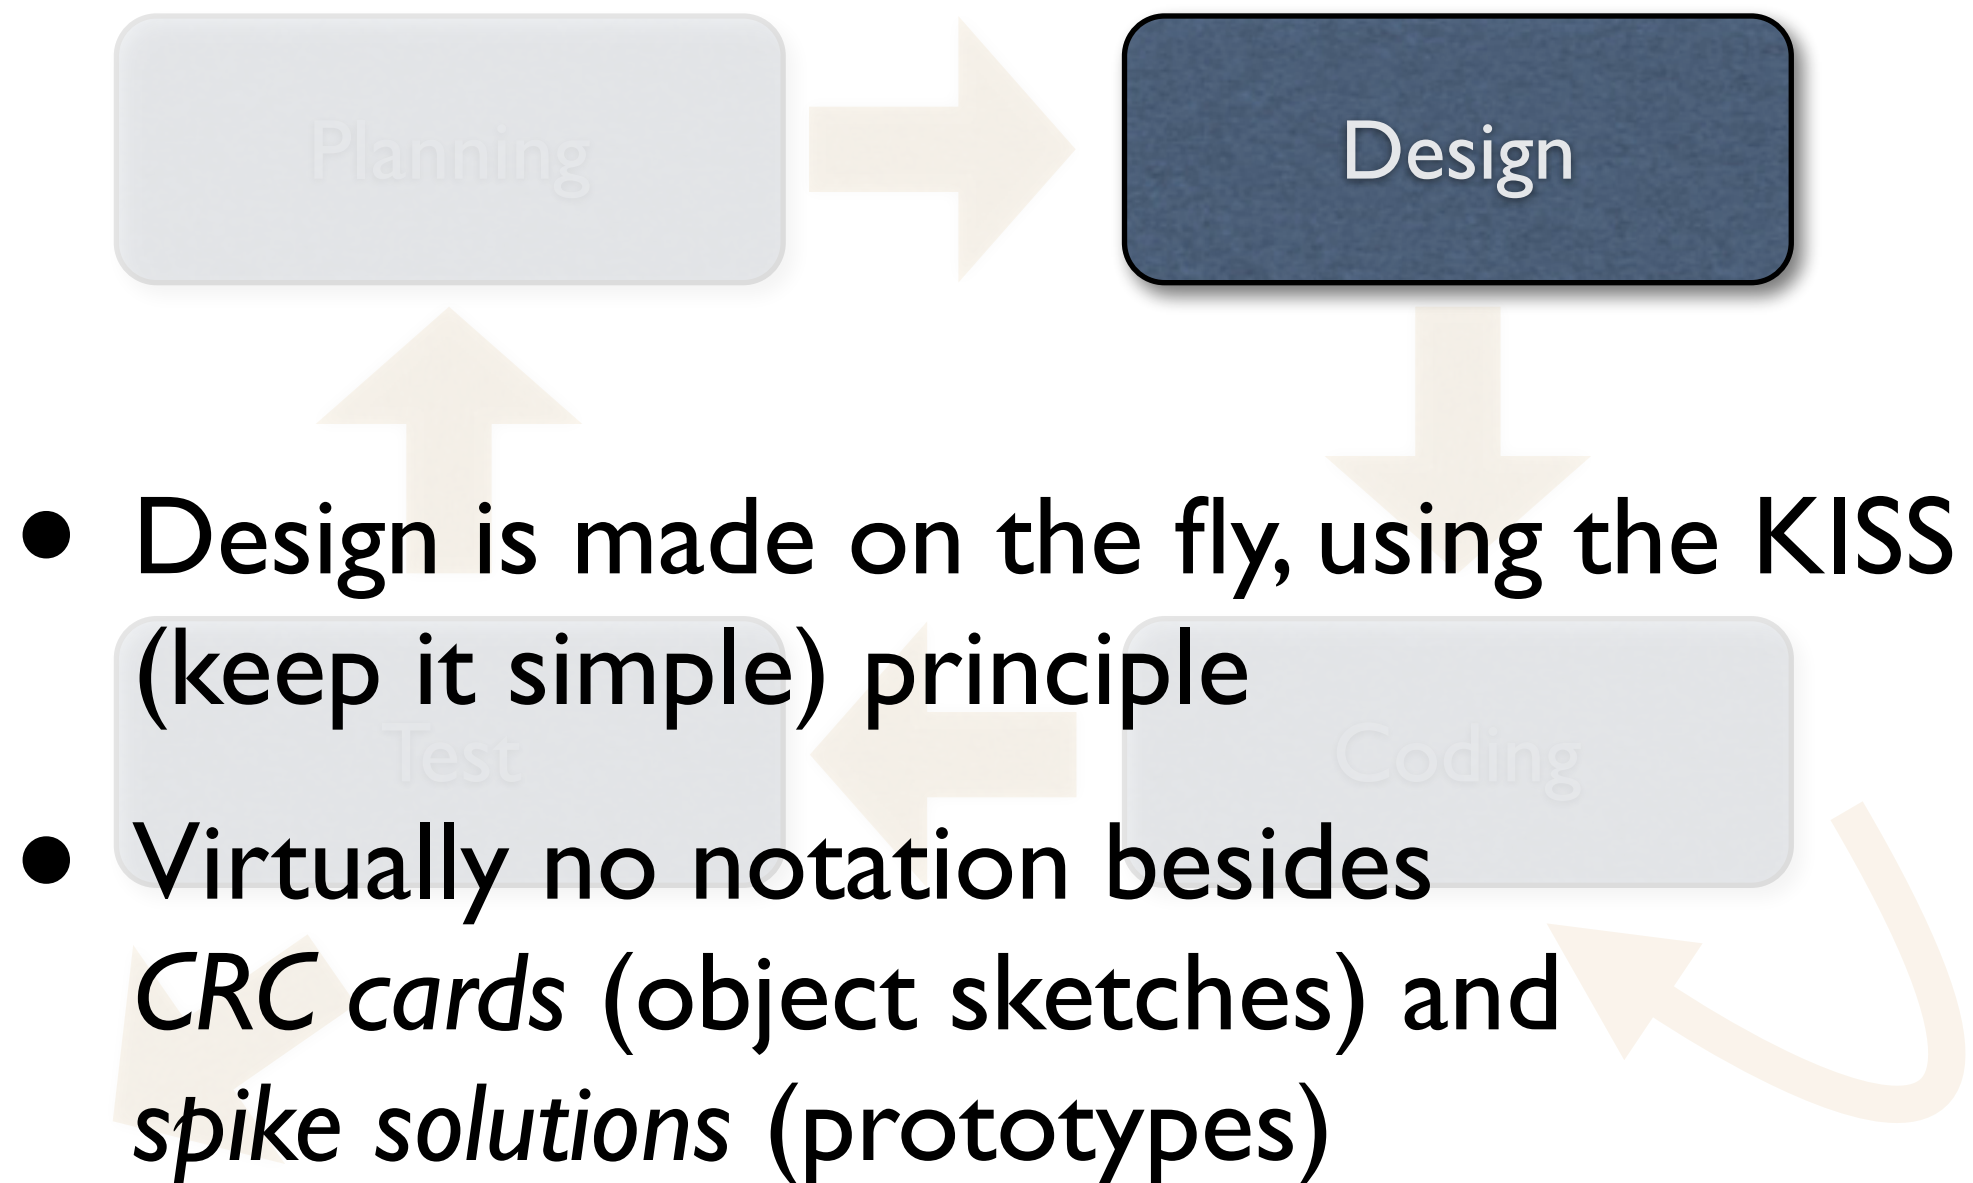

I want to be able to create a new Booking by dropping a Location directly onto another Location, indicating pick-up and drop-off. This should work whether I am doing it from a Customer's list of frequent locations, or a City's list, or both. **7**

# Extreme Programming

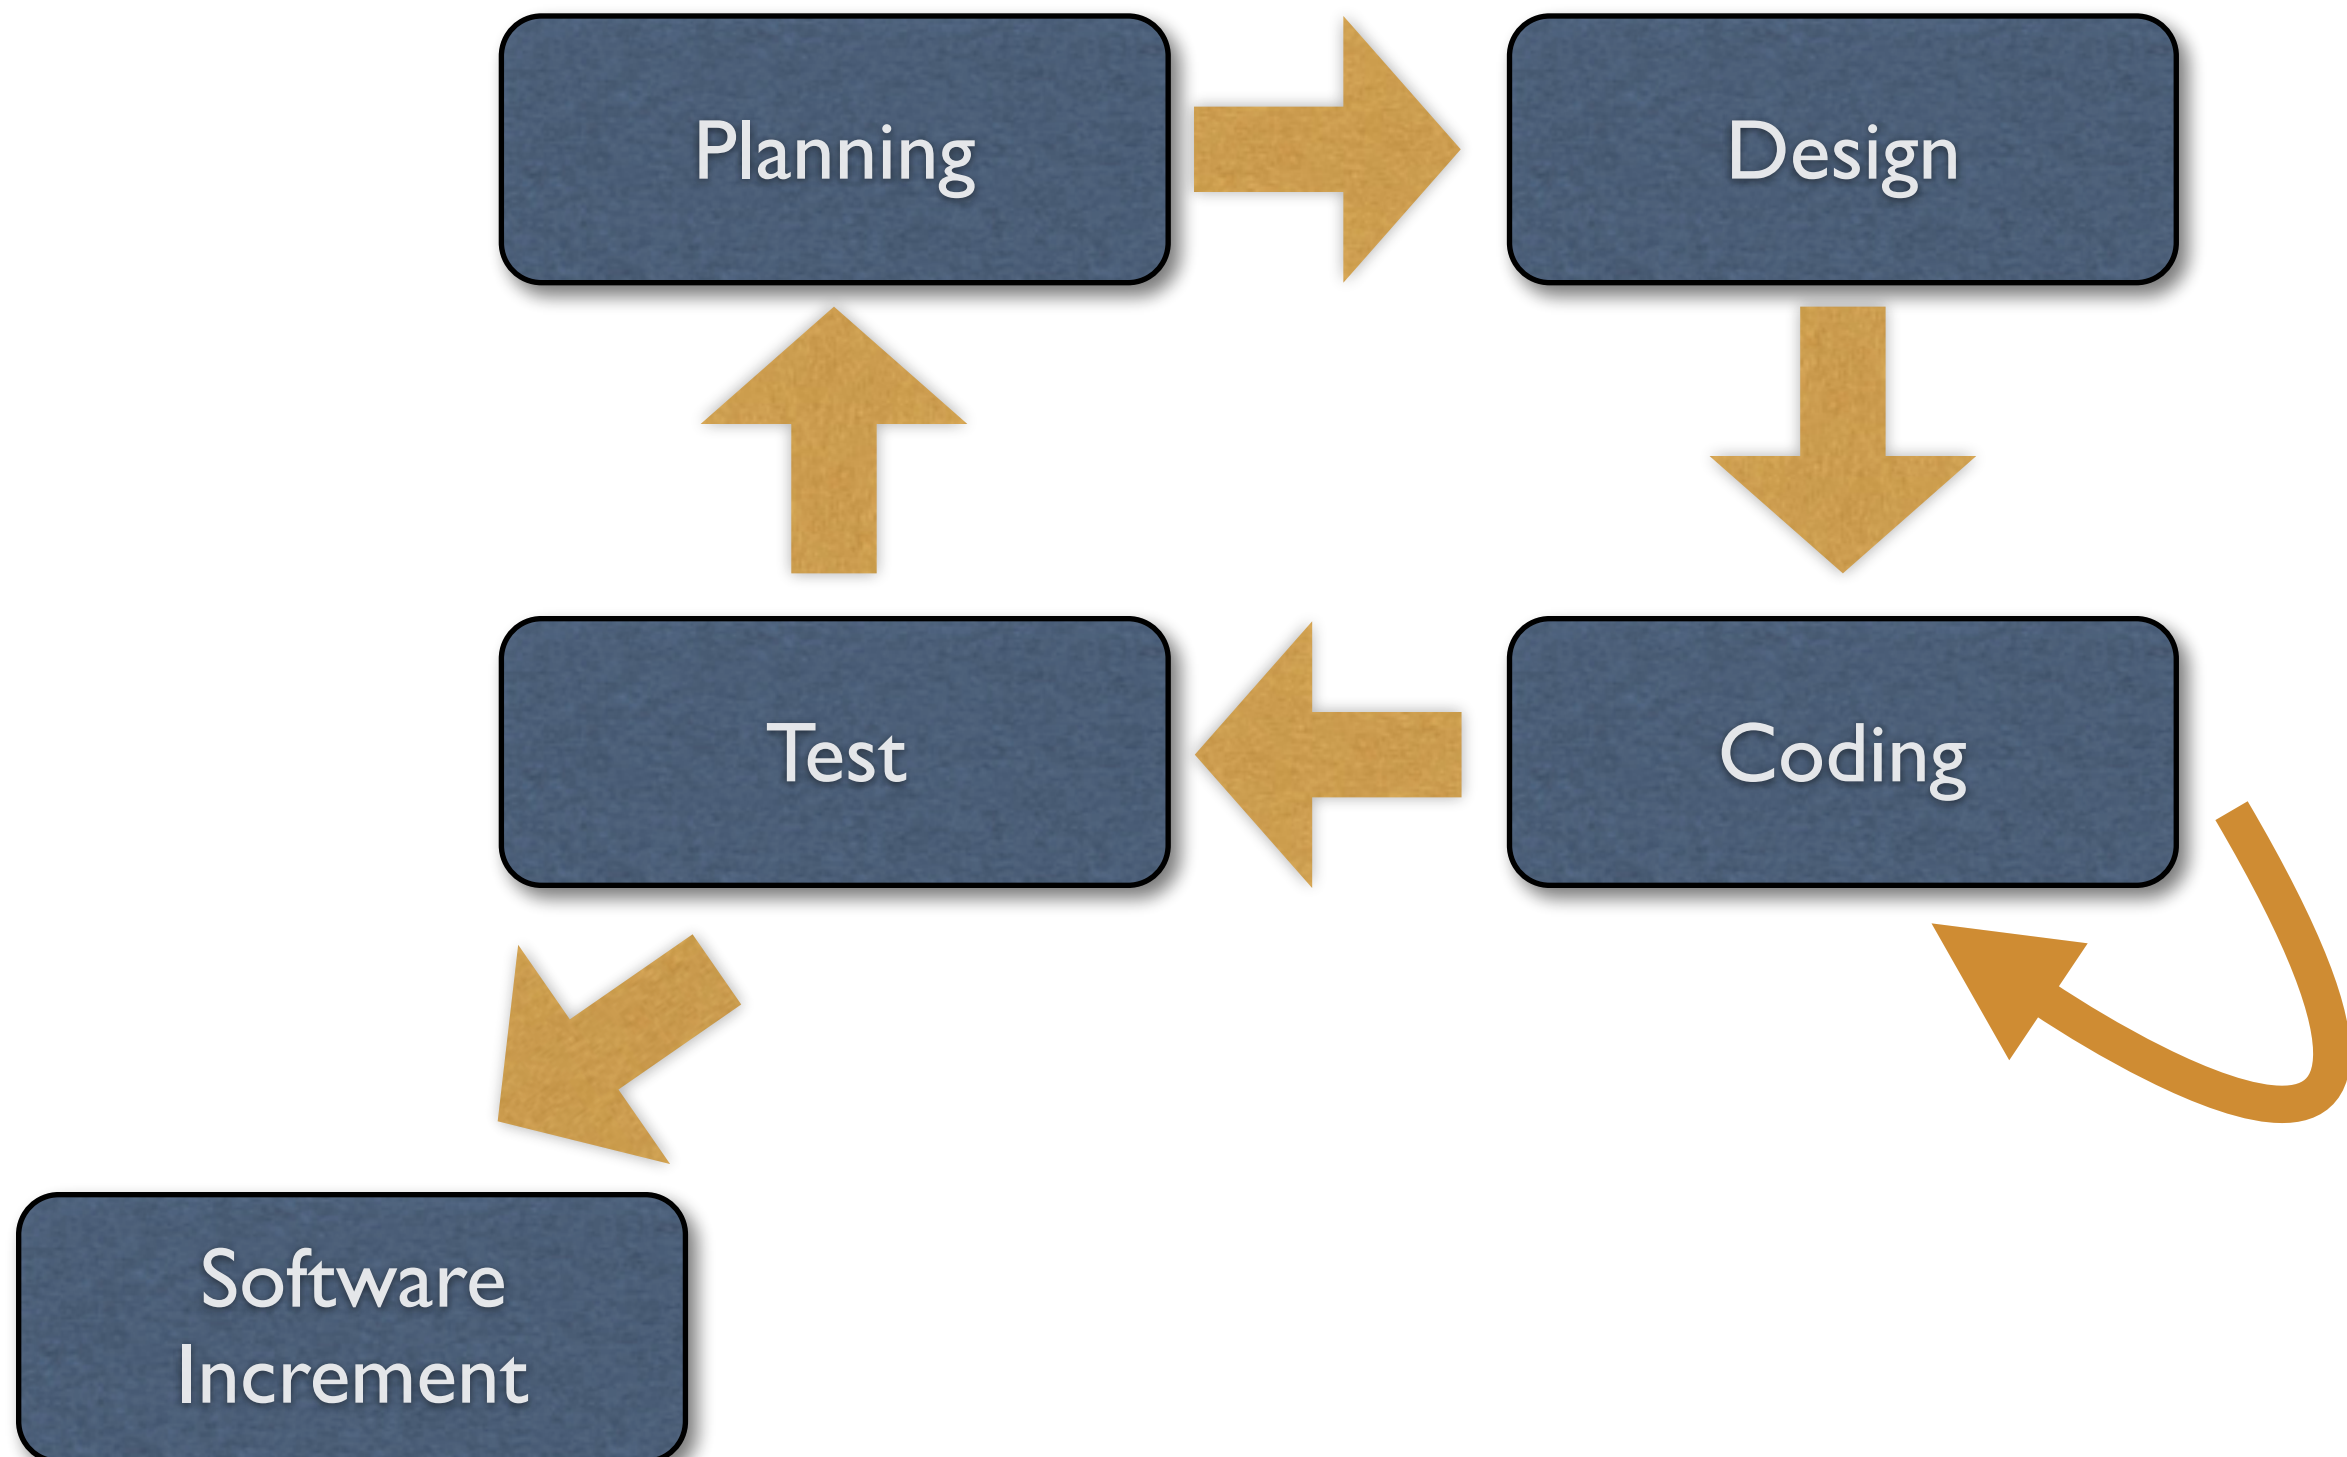

# Extreme Programming

Software  
Increment

# Extreme Programming

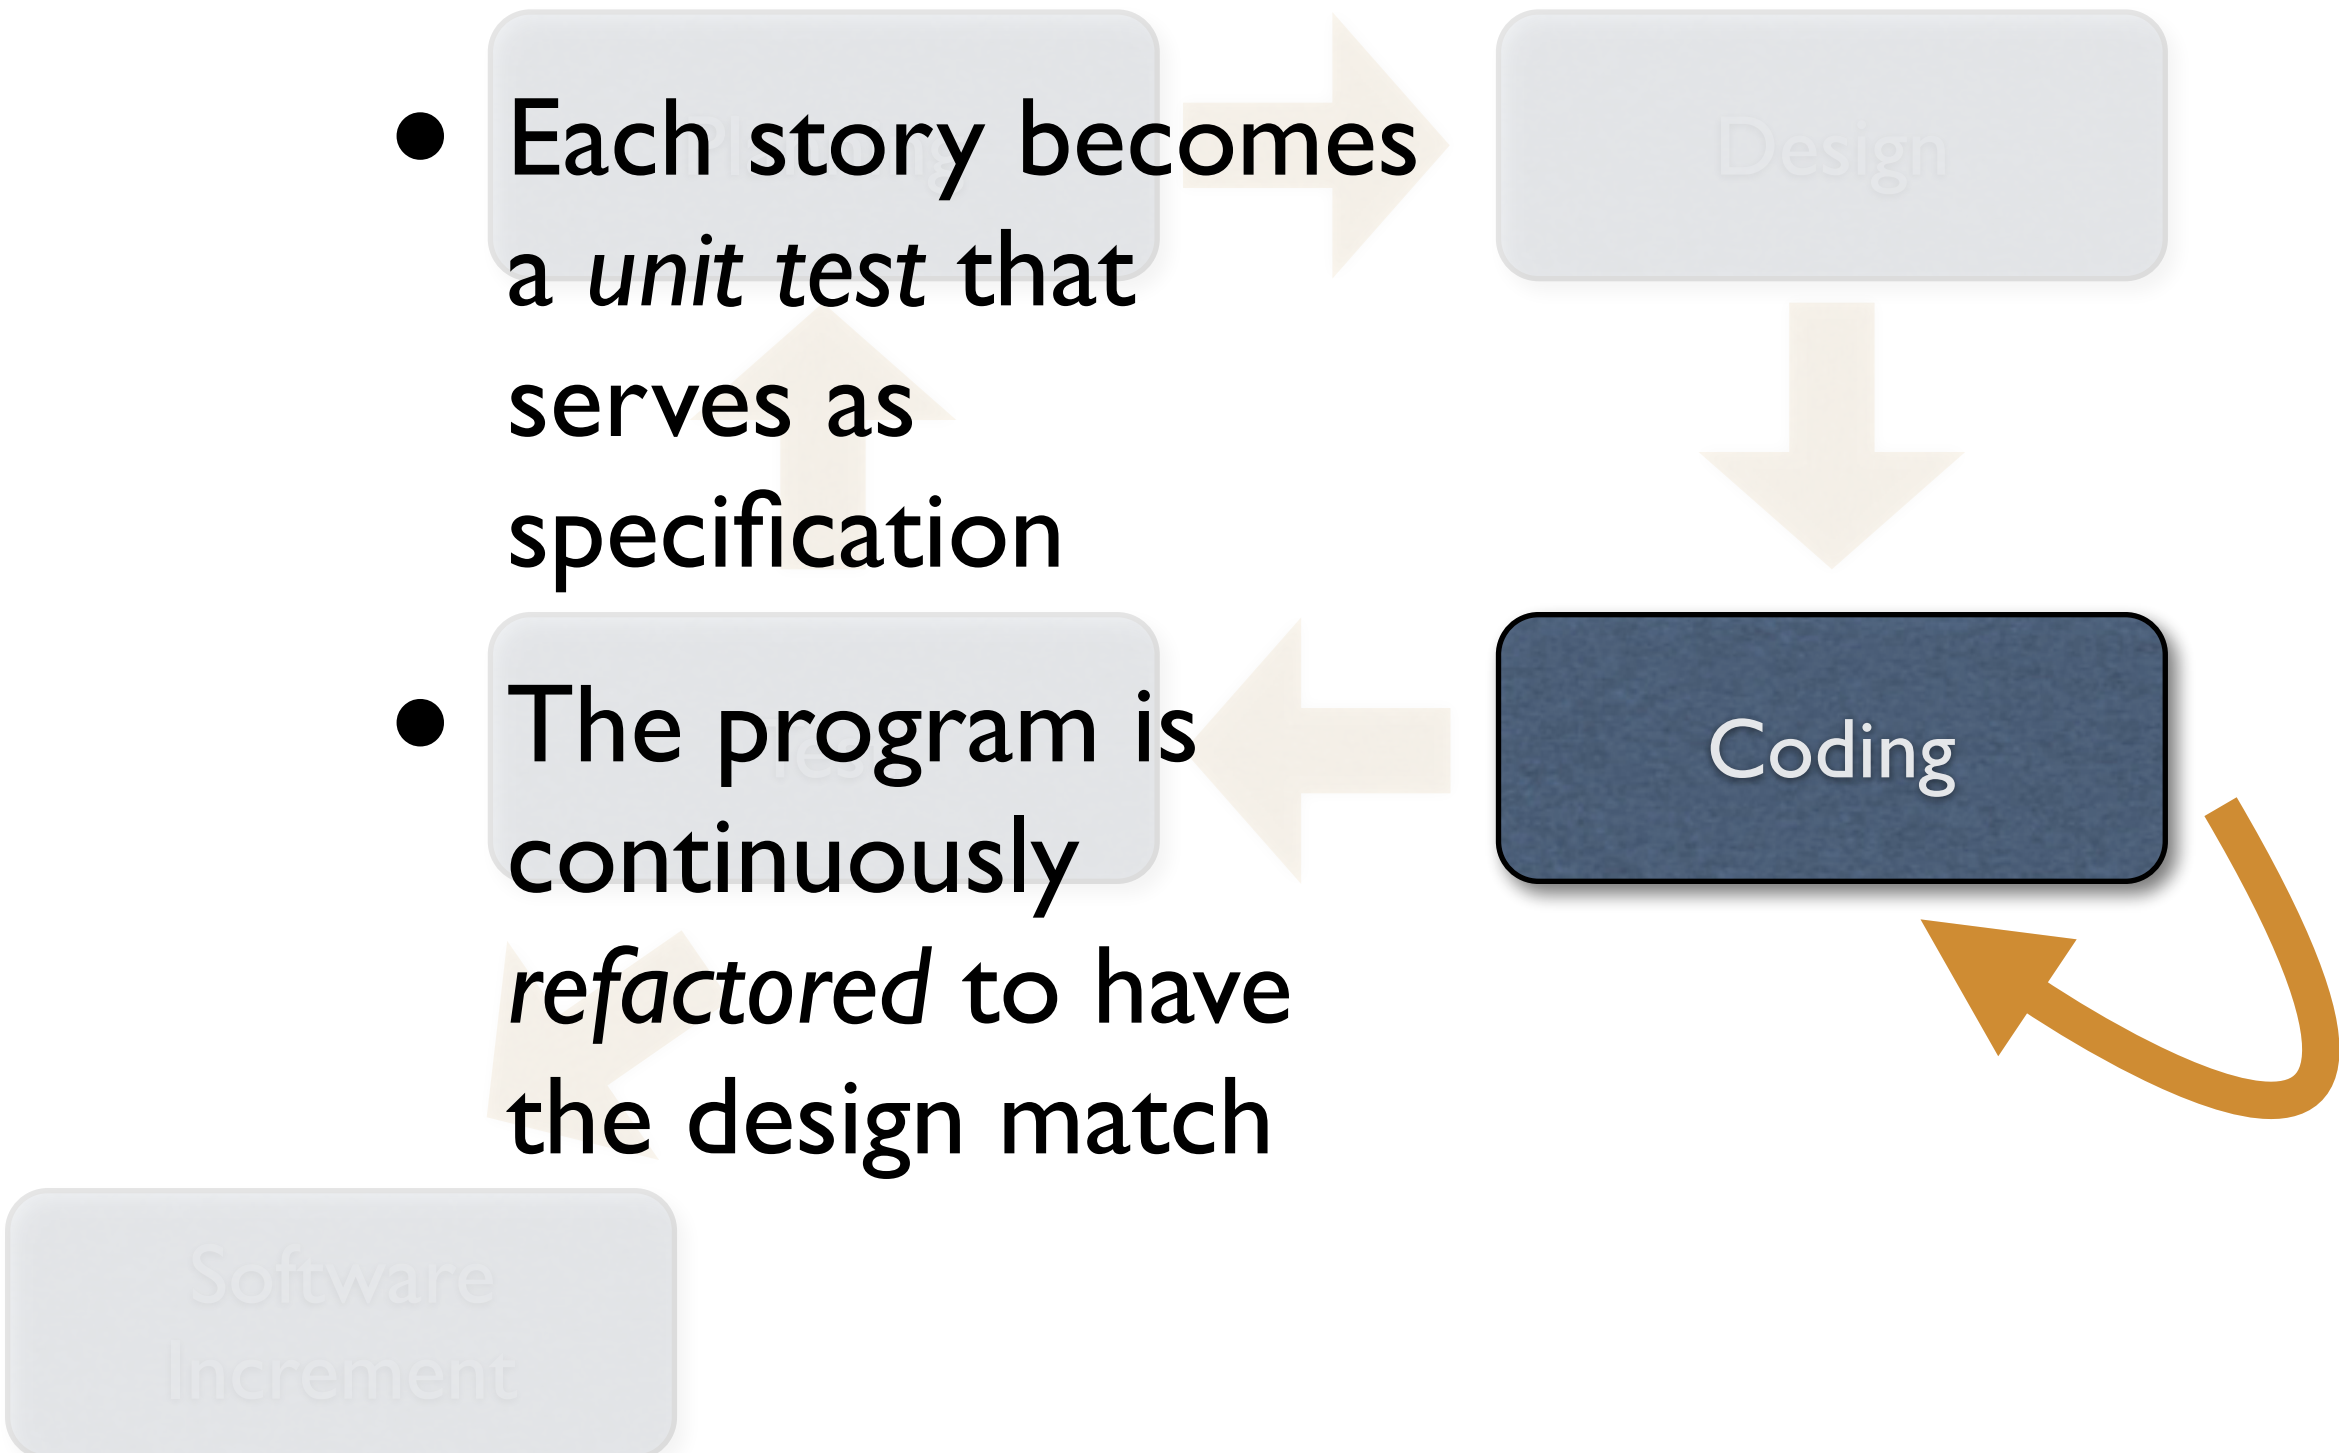

# Coding

- Each story becomes a *unit test* that serves as specification
- The program is continuously *refactored* to have the design match

Design

Coding

Software  
Increment

# Coding

Planning

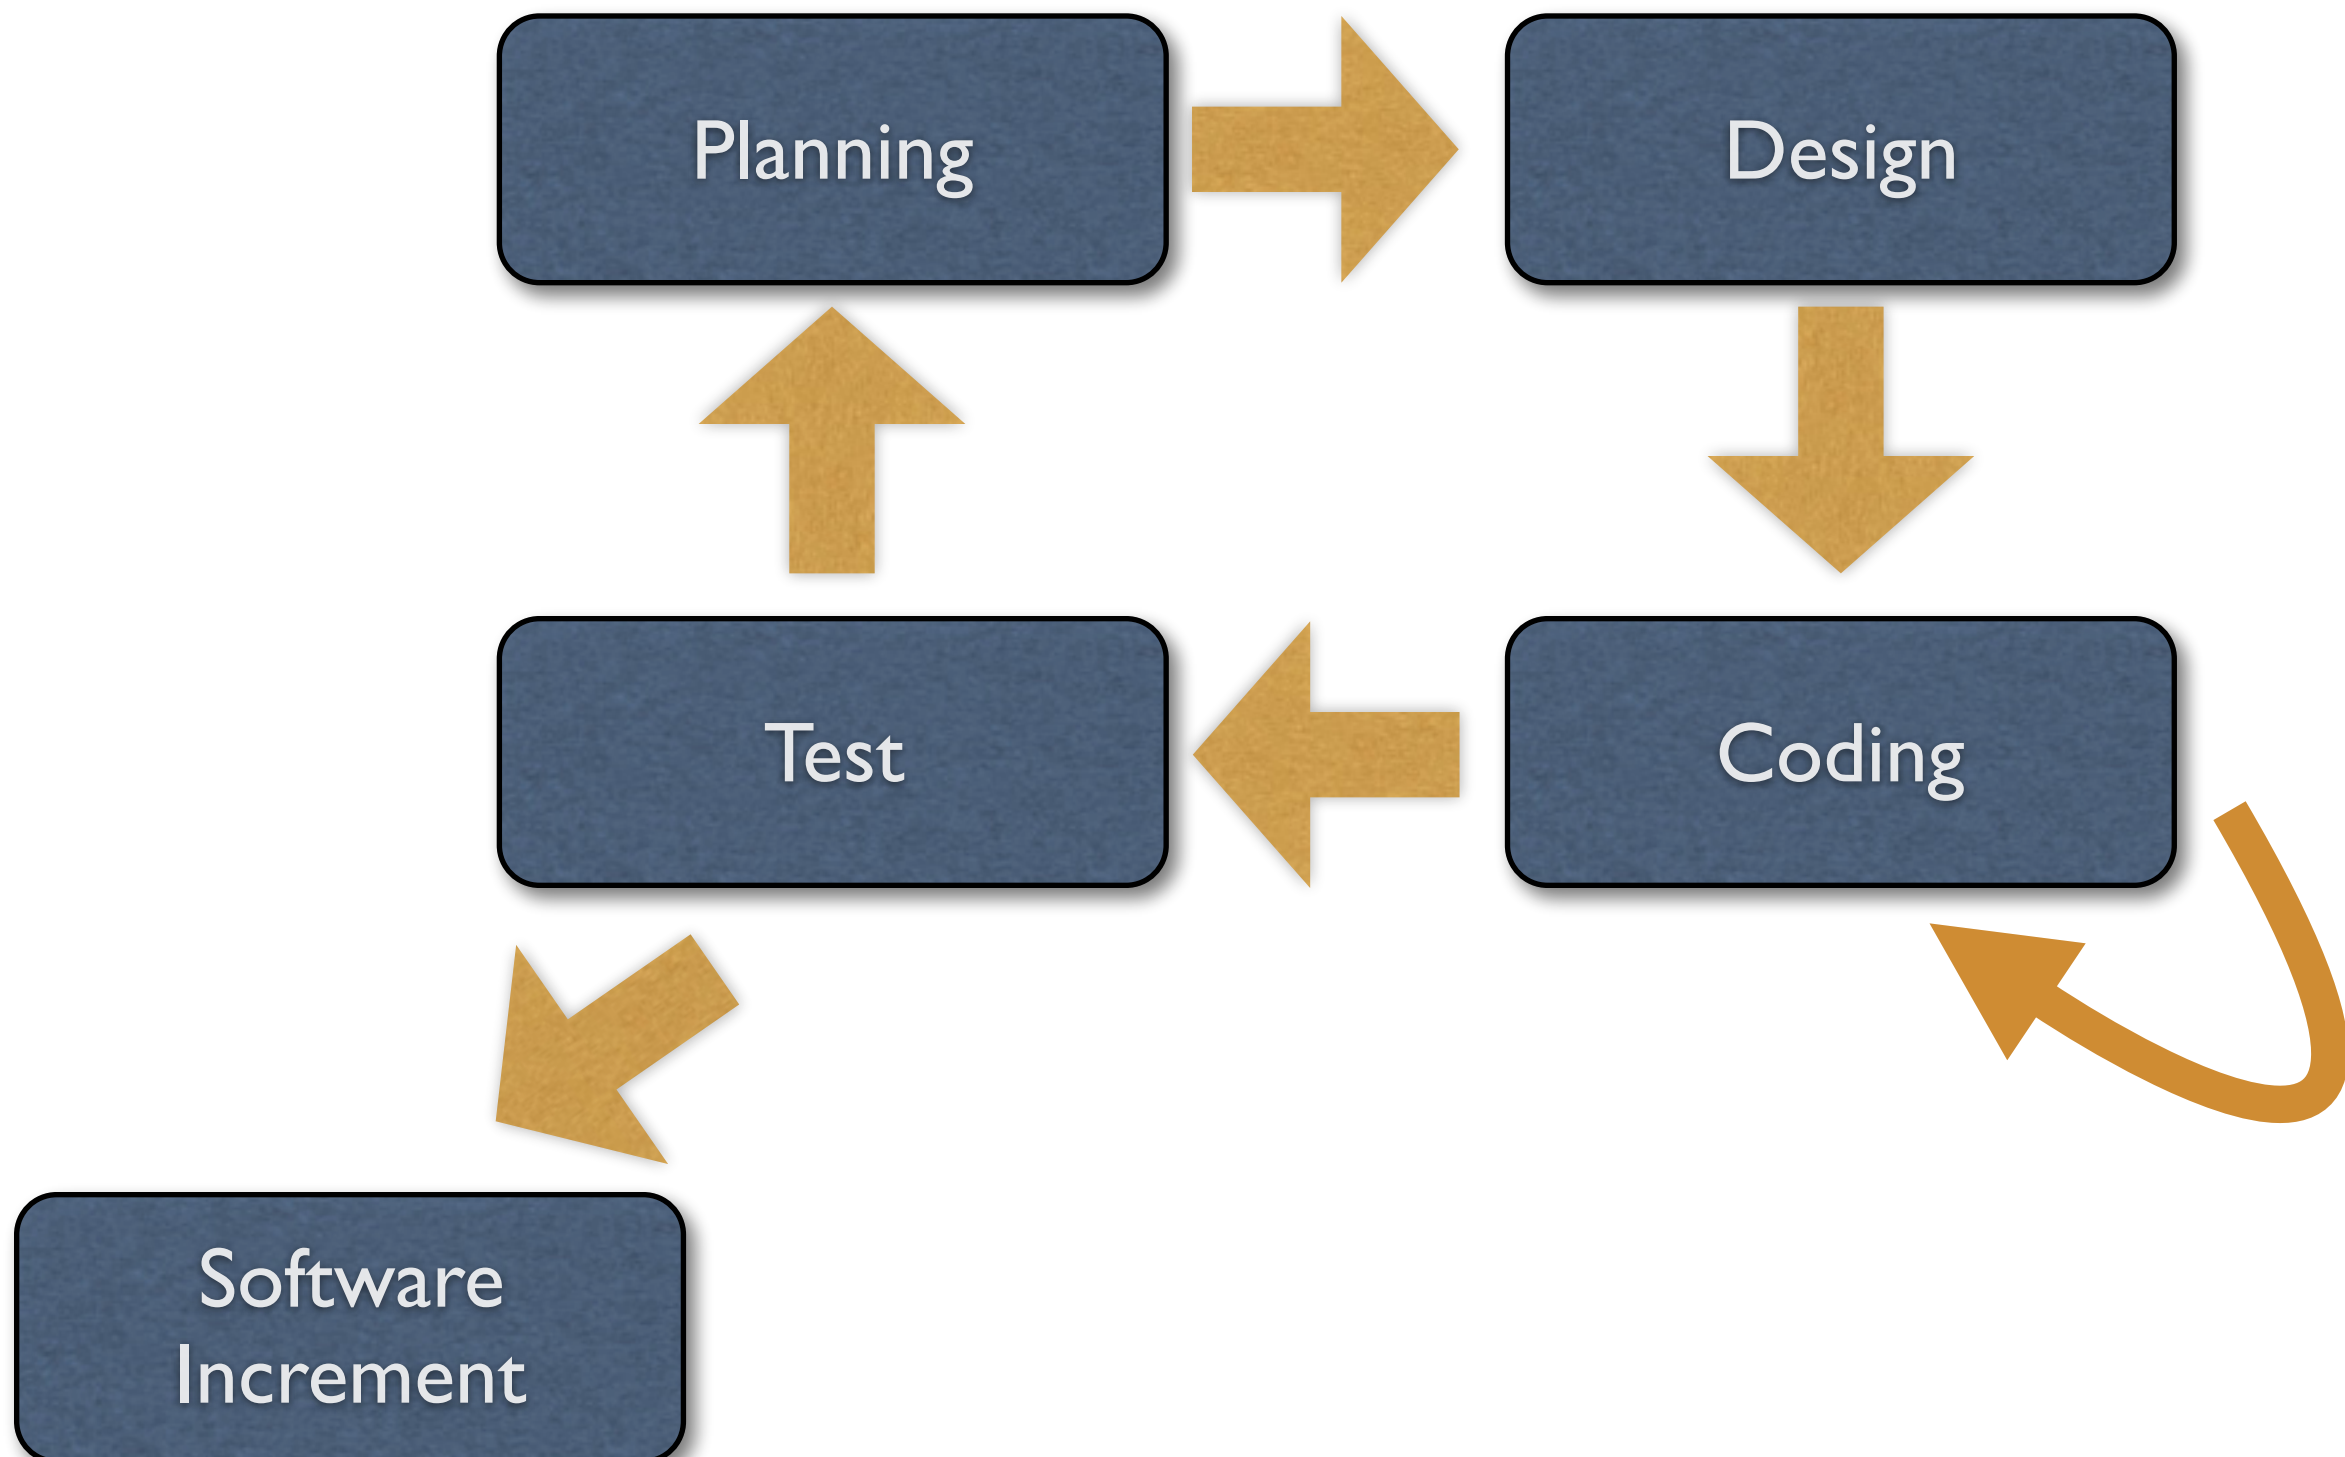

Software  
Increment

- To ensure continuous review, XP mandates *pair programming*

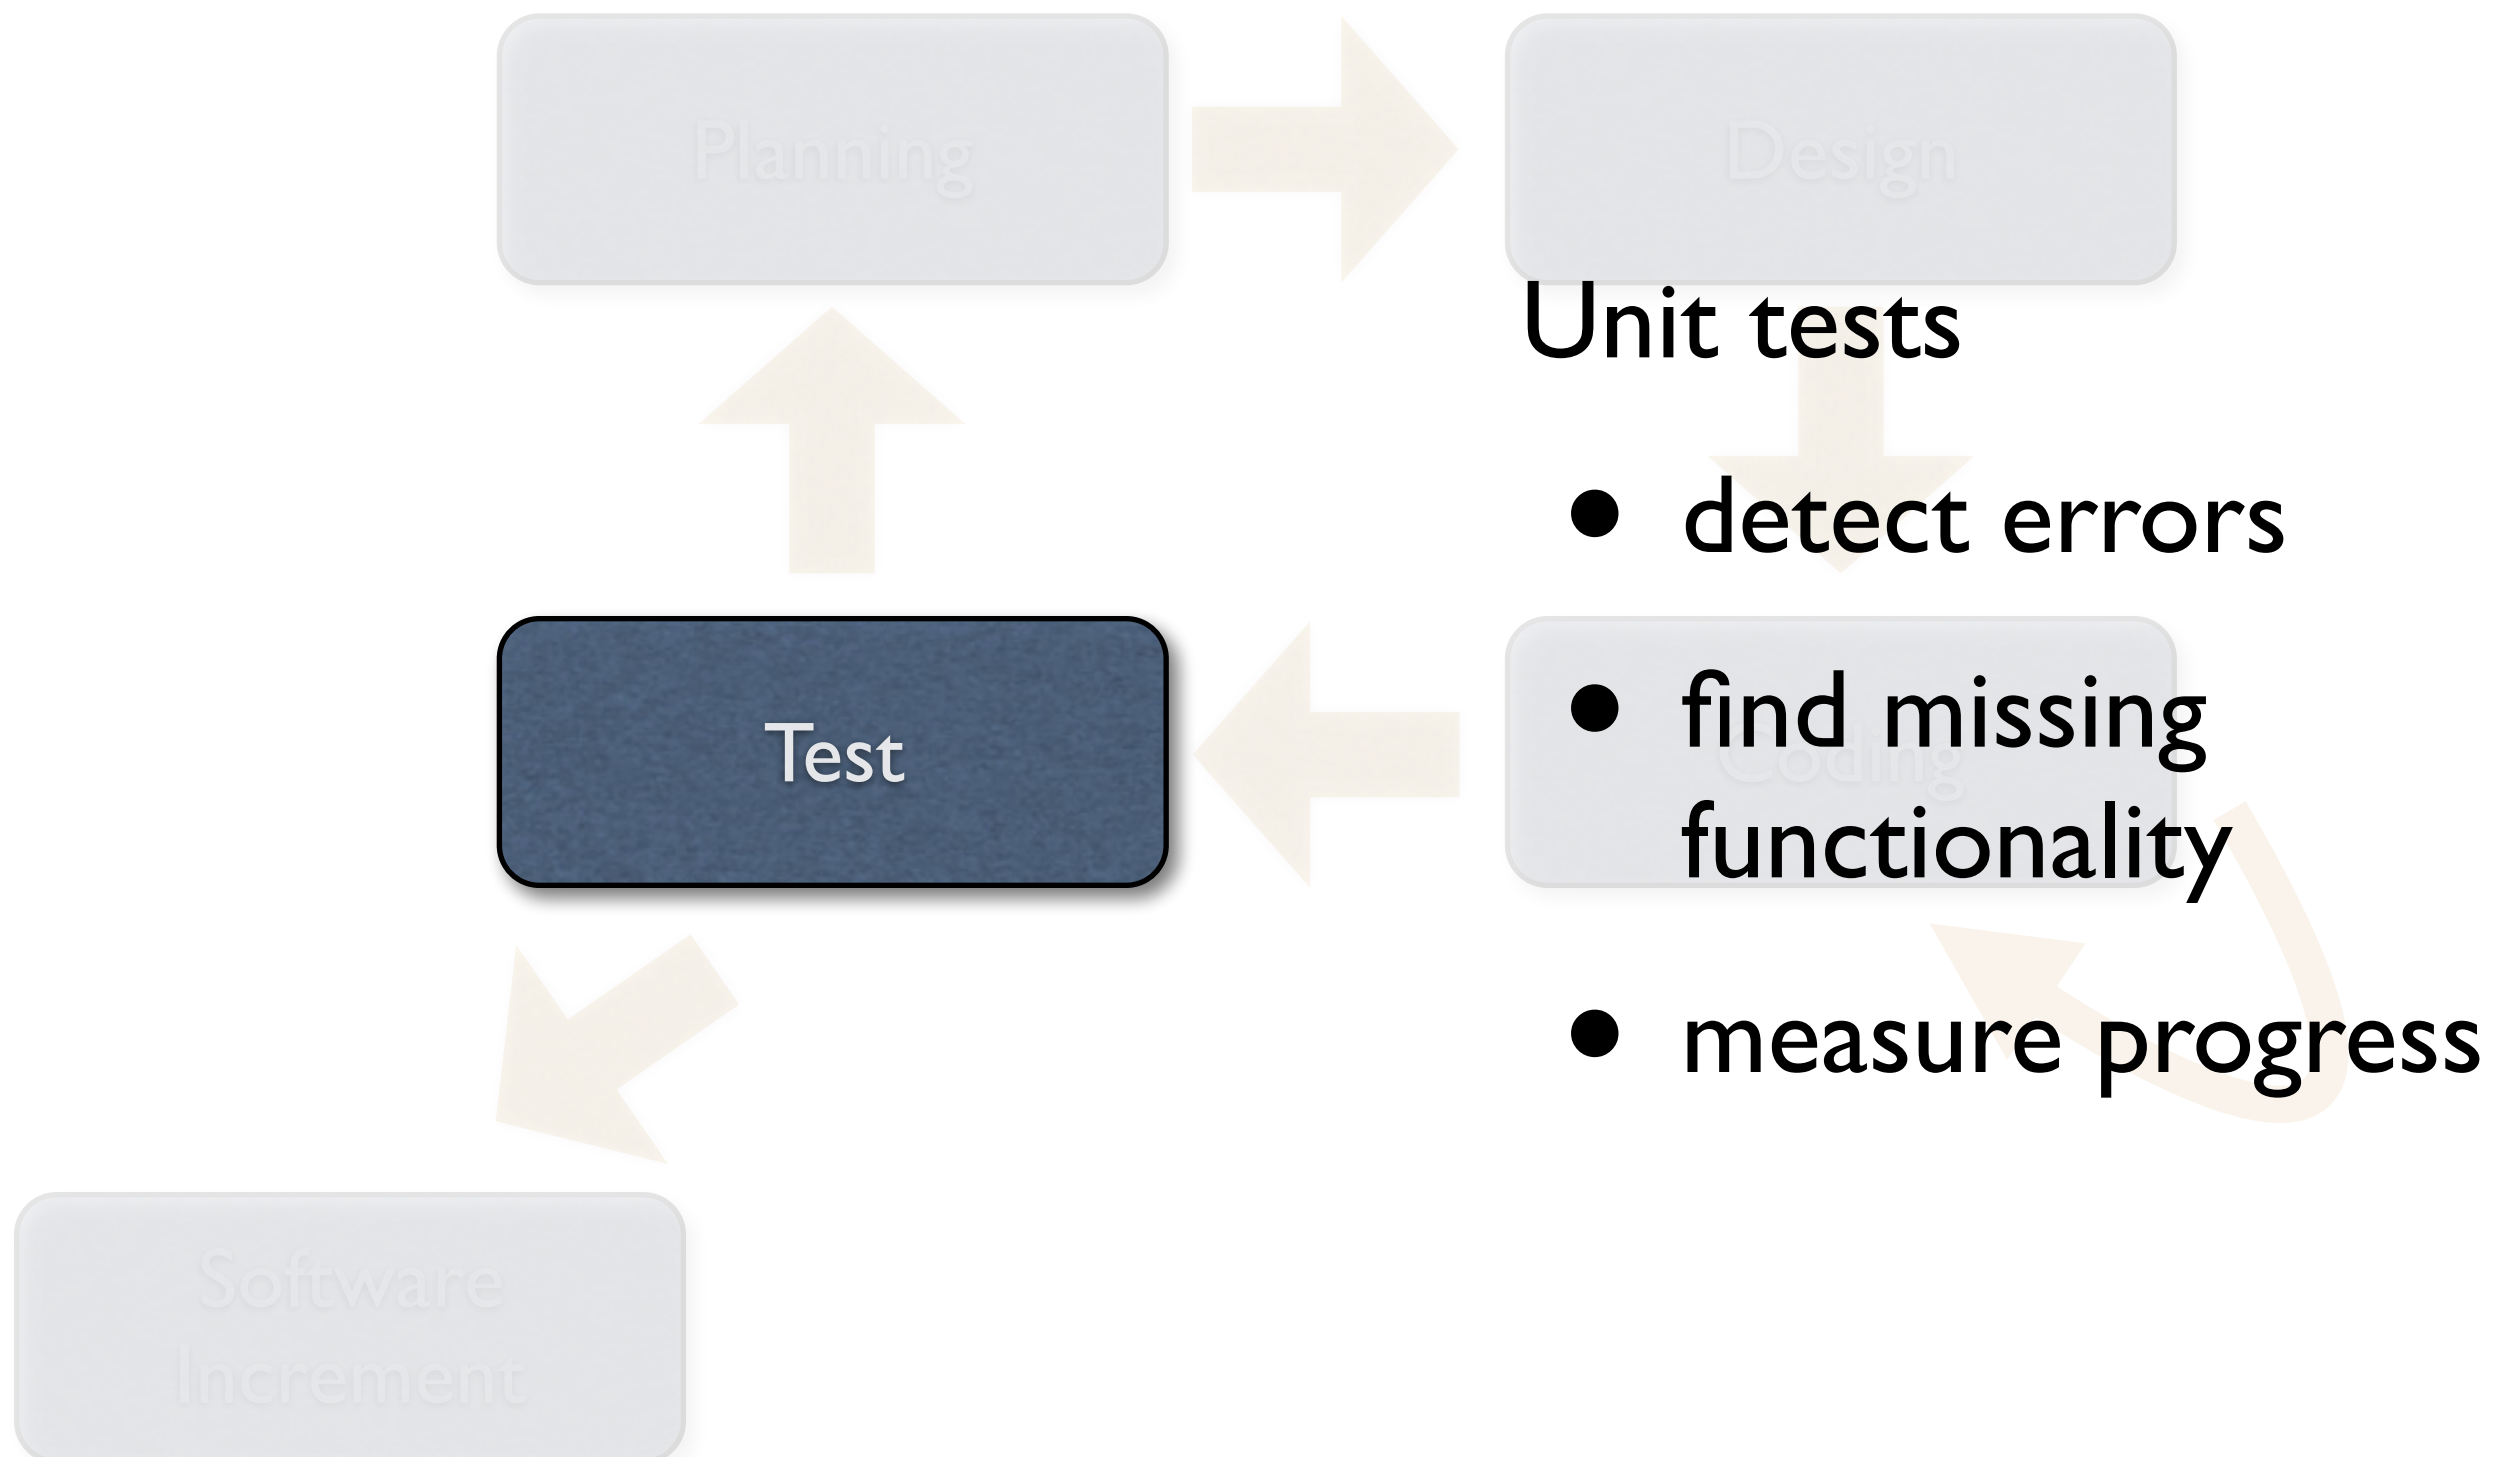

Coding

# Spot the Difference

## Extreme Programming

## Code and Fix

(1950–)

# Scrum

# Scrum

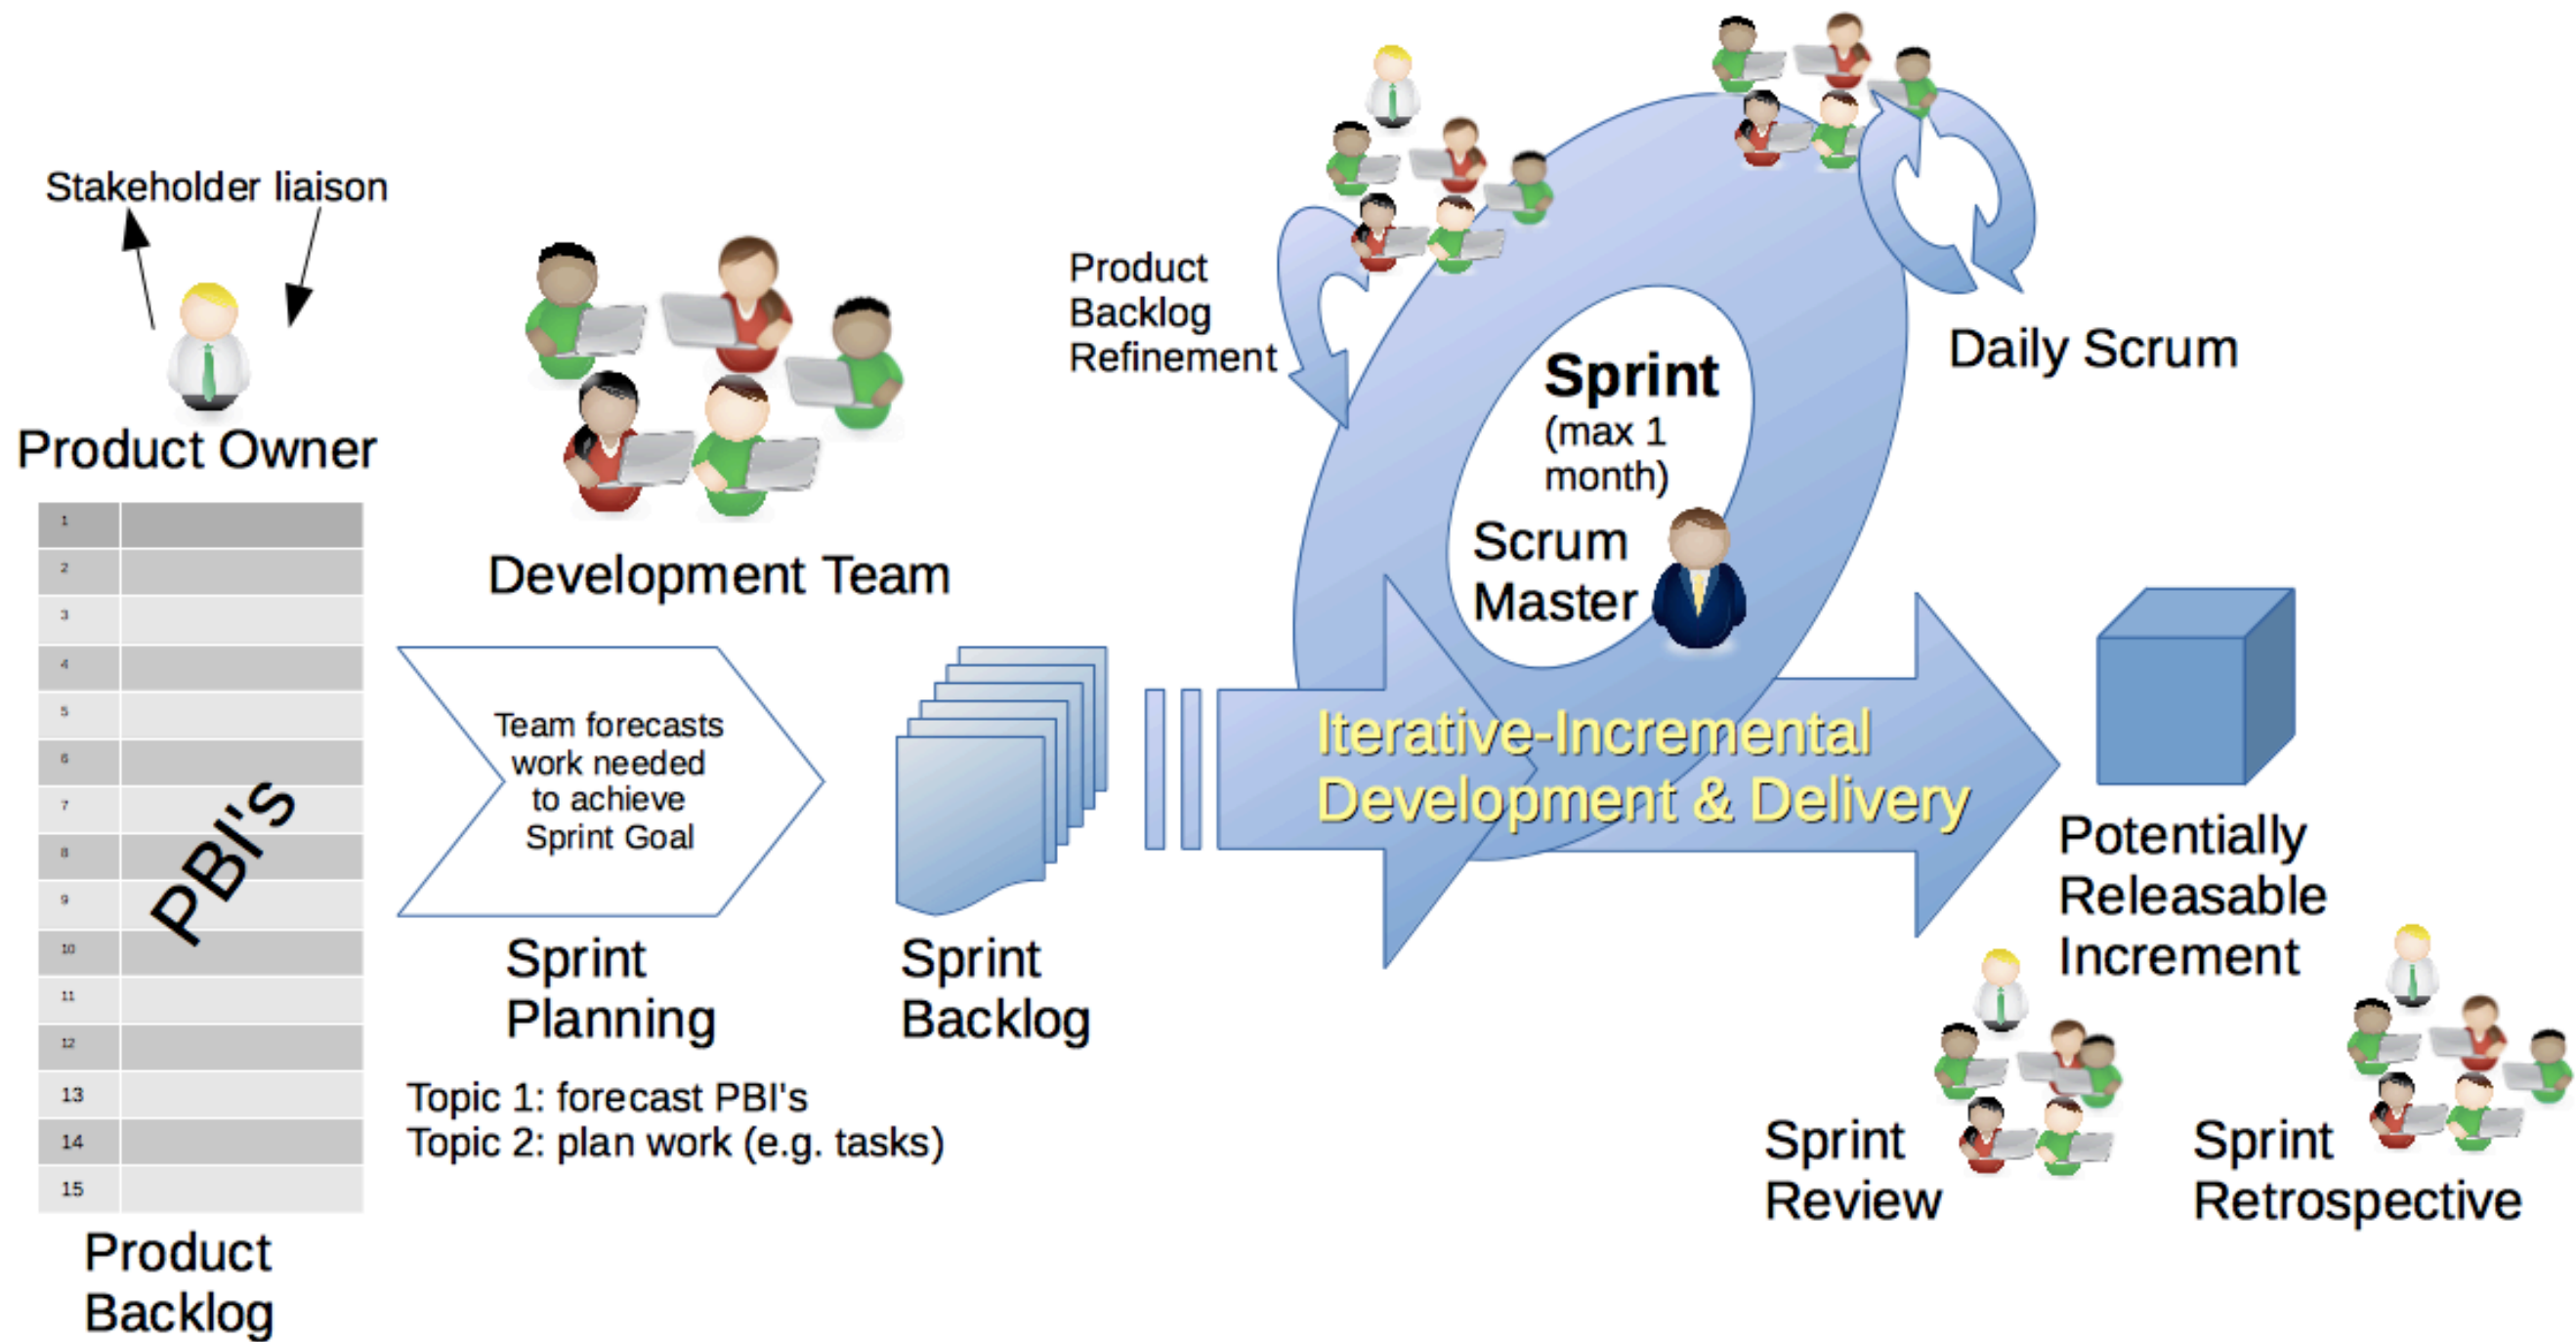

- An iterative and incremental agile software development method for managing software projects and product or application development.
- Small working teams to maximize communication, minimize overhead and maximize knowledge sharing.
- Adaptable to technical and business changes.
- Yields frequent software increments that can be inspected.

# Scrum

- Development work and the people who perform it are partitioned into clean, low coupling partitions.
- Constant testing and documentation is performed.
- Ability to declare project “done” whenever required.

# Scrum

# Scrum

*Backlog:* A prioritized list project requirements or features that provide business value.

*Sprints:* Consists of work units that are required to achieve a defined backlog into a predefined time-box (usually 30 days).

*Scrum Meetings:* Short 15 mins. meetings held daily by the scrum team. The Scrum master leads the meeting.

*Demos:* Demonstrate software increment to the customer for evaluation.

# Daily Scrum

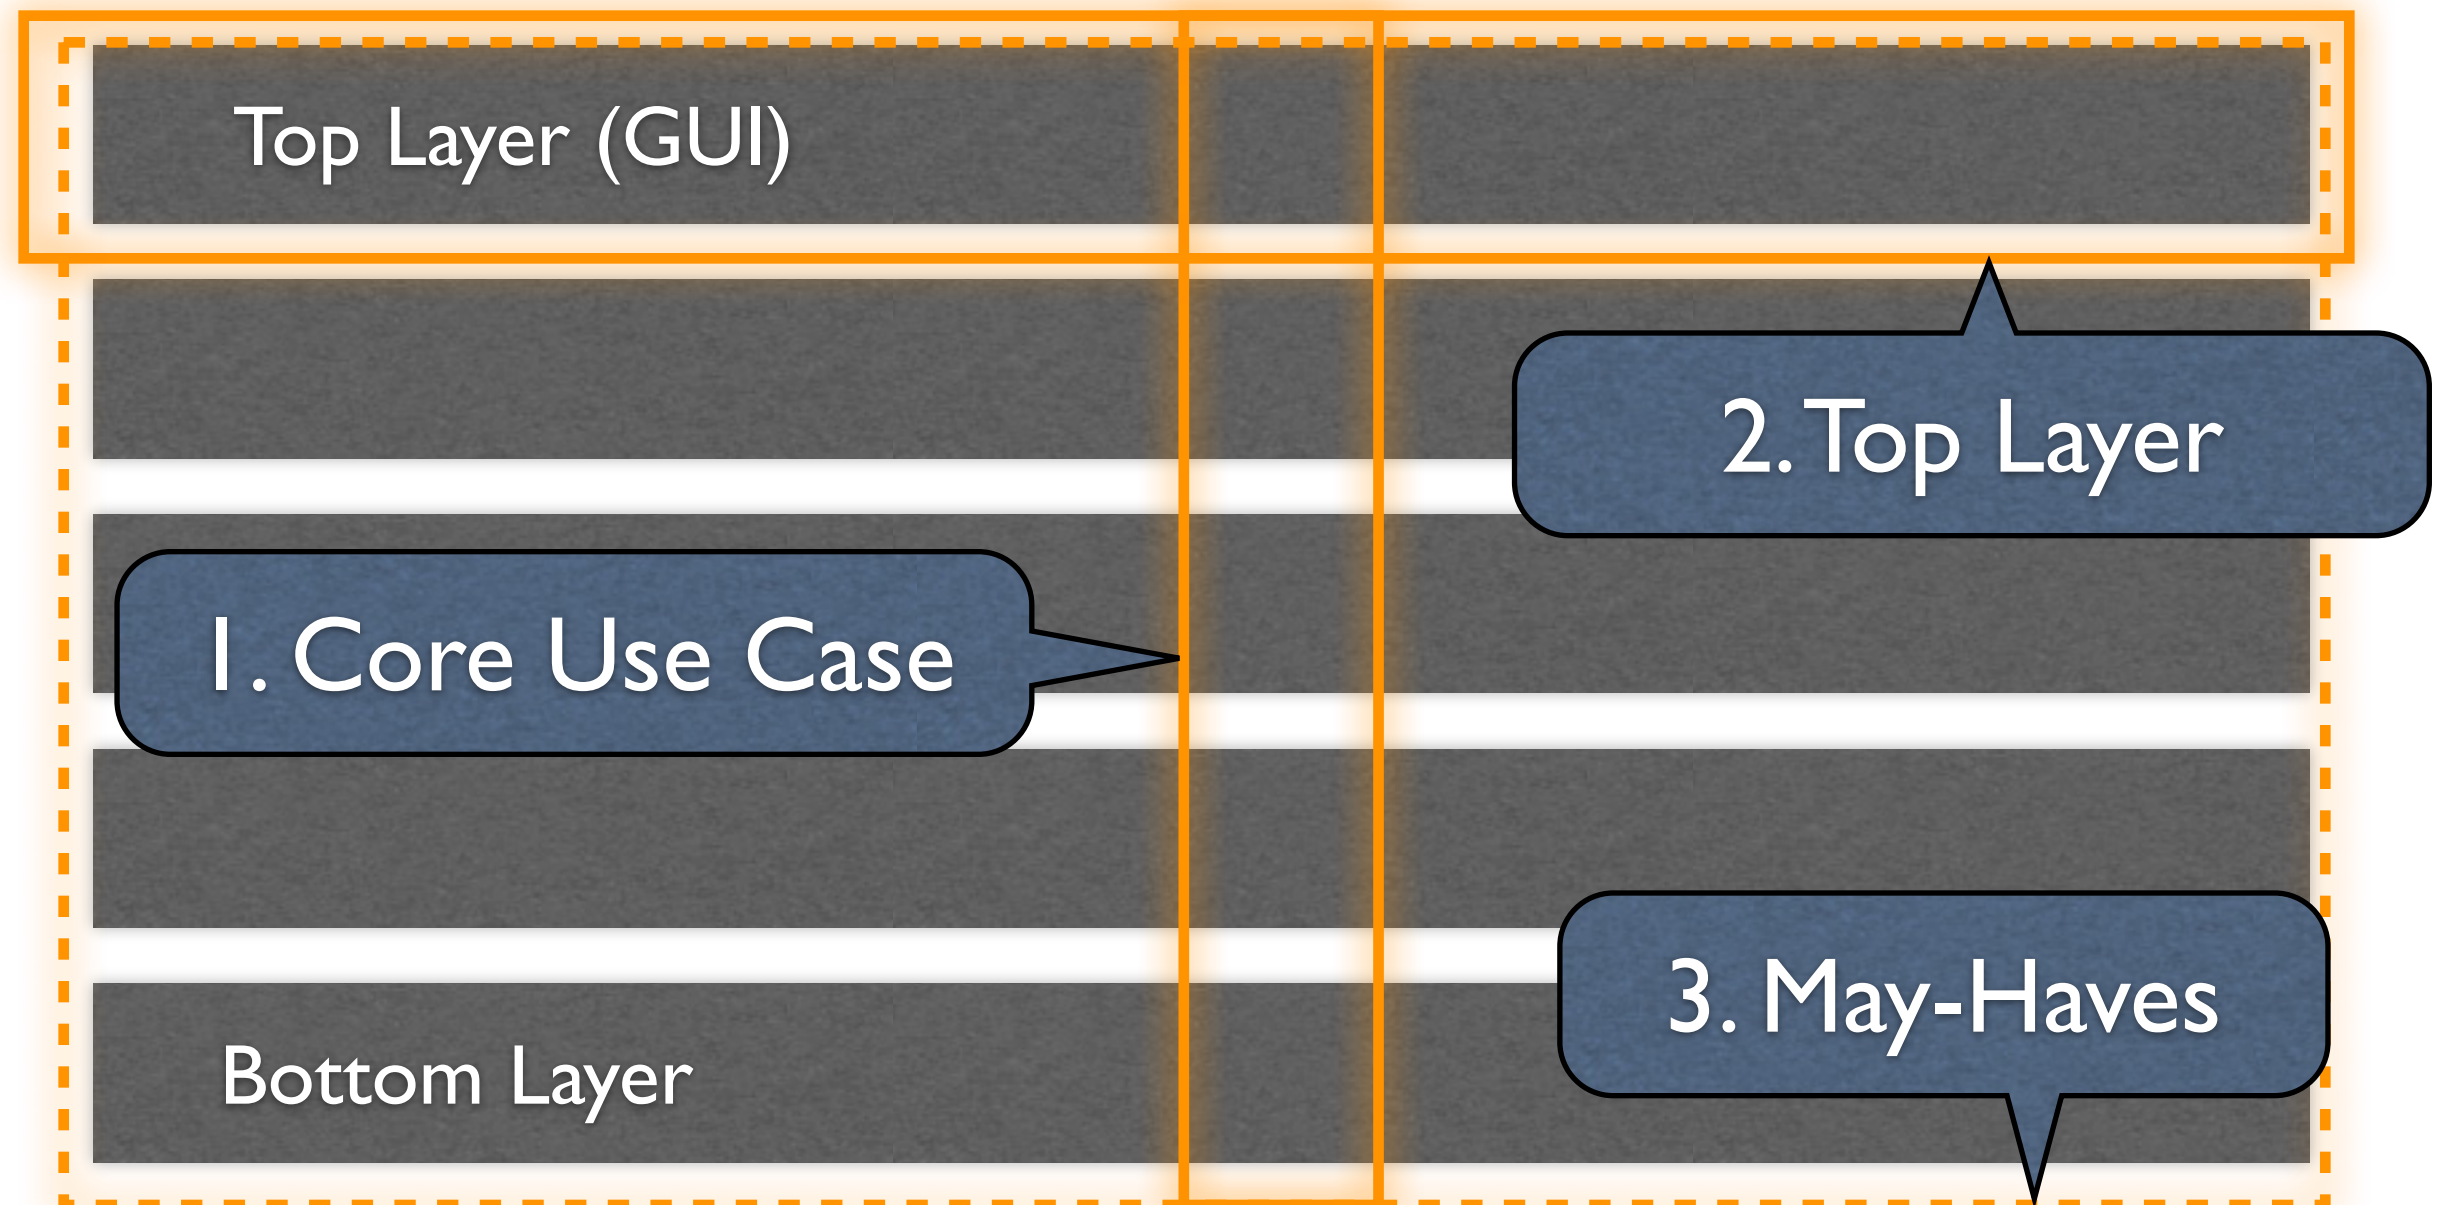

# Daily Scrum

Each day during a Sprint (same time + place), the team holds a *Daily Scrum*, where each team member answers three questions:

1. What did I do *yesterday* that helped the Development Team meet the Sprint goal?
2. What will I do *today* to help the Development Team meet the Sprint goal?
3. Do I see any *impediment* that prevents me or the Development Team from meeting the Sprint goal?
